DESCRIPTION

Logic Board 19D902151G3 controls the operation of the MTD SERIES mobile radio. The Logic Board contains a microcontroller and associated memory circuits which include an EPROM for controller software, a programmable EEPROM to store customer System/Group Sets, frequencies and options, and RAM for controller working memory. MTX and MRX modem data from the Audio Board are controlled by a Modem IC on the Logic Board.

The Logic Board also contains latch circuitry for tone generation, data I/O and volume control. An electrically erasable potentiometer (EEPOT) is used for the volume control. In addition, the board provides the audio paths between RF Board A3, Audio Board A2 and the Control Board (Front Cap).

The logic board mounts on the bottom of the frame assembly underneath the Audio Board. A Block Diagram of the Logic Board is shown in Figure 1.

The logic board generates and receives the control signals described in Table 1

CIRCUIT ANALYSIS

A description of the symbol numbers used in the following text is contained in the Block Diagram, Outline and Schematic Diagrams, and Parts List as listed in the Table of Contents above. Also, refer to the IC/Module Data Sheets for pin out information (see Table of Contents).

MICROCONTROLLER, DECODER AND LATCH

Microcontroller U701 is an 8-bit, control-oriented microcomputer with internal input/output interface (I/O), and 256x8 random access memory (RAM). The microcontroller provides all of the radio timing and control signals. An 11.0592 MHz external crystal (Y701) is used for clocking.

Microcontroller U701 controls the following circuits:

- Synthesizer
- Transmit circuit
- Decoding of RX Data
- Generation of TX Data
- Microphone, Speaker and Data mute gates
- Generation of Signalling Tones

Ericsson Inc. Private Radio systems Mountain View Road Lynchburg, Virginia 24502 1-800-528-7711 (Outside USA, 804-528-7711

Figure 1 - Logic Board Block Diagram

Communications between the microcontroller and control board (on MTD) is by 9600 Baud serial data.

Keypad and Display Serial lines are RXD and TXD respectively are for PC Programmer operation. A 9600 Baud, RS-232 ASCII link interfaces the radio to the PC Programmer. These lines are also used in serial communications with other devices (Control Board, RDI, and external logic boards).

Two additional ICs directly support the controller. U703 is an Octal 3-state, non-inverting transparent Latch used with ALE (Address Latch Enable). U703 is used to demultiplex the controller Address/Data Bus. U702 is a three bit address to one-of-eight active low decoder outputs. It uses address lines A13, A14 and A15 as inputs, and provides Chip Enables for INPRT (U710 I/O EXP), OUTPRT (U709 D Latch), RAM (U707) and Modem (U708). NOR gate (U713) combines Read and Write to the enable signal for INPRT and OUTPRT.

ERASABLE PROM (EPROM)

EPROM U706 is a 64 K x 8 bit, ultraviolet Erasable and Electrically Programmable Read Only Memory. U706 stores all the software routines required by the controller for radio operation. The EPROM does not contain any customer specific information.

Table 1 - Control Signals

LBI-38616B

ELECTRICALLY ERASABLE PROM (EEPROM)

EEPROM U704 is a 2048 x 8 bit memory device designated the personality PROM. This personality PROM stores all required Customer information, which includes:

- Group Sets and System Sets
- Frequencies
- Options

The EEPROM can be conveniently programmed through J701 on the Logic Board without opening up the radio.

RAM

The (U707) IC is a 8 K x 8 bit, High Speed Static CMOS RAM. This IC is used by the controller for additional temporary data storage during radio operation.

MODEM AND JK FLIP FLOP

Modem chip U708 provides for transmitting and receiving 9600 or 4800 baud, high speed data. This is performed by serial/parallel and parallel/serial conversions for MTX and MRX data respectively. The controller passes and receives modem data on the parallel Data bus. Another Modem chip function is to provide for a "watchdog timer" in controller operation. Whenever the timer is not routinely set, as with a software failure, the modem IC re-initiates the system startup (powers up the radio).

LBI-38616B

A 11.0592 MHz clock signal is provided for microcontroller operation by crystal Y701. A JK Flip Flop (U711) performs a divide by two function to provide the 5.5296 MHz used by the modem in the 4800 baud mode of operation

BUS TRANSCEIVER

U710 is an Octal, 3-state, non-inverting Bus Transceiver. Grounding pin 1 of I/O expansion IC U710 permits data to pass in only one direction. CAS (Squelch) and RX Tone Data are applied to the Logic Board from the Audio Board. PTT, Serial Request, Keypad and Display Serial data are applied from the Control Unit (MTD) or external units. The output of U710 is applied to the Data Bus.

D-TYPE FLIP-FLOP AND EEPOT

U709 is an octal D-type flip- flop that is used to latch the RX MUTE, UP/DN, INC and Signal Tones from the microcontroller. Signal Tones generated by the microcontroller are latched and transformed into sine waves (digital to analog conversion) by resistor network R723. The network output is applied to Op Amp U705B for the required gain.

The UP/ $\overline{\text{DN}}$ and INC signals are used to control the direction and value of EEPOT U714. The digitally controlled potentiometer has a minimum resistance of 40 ohms, and a maximum resistance of 10 K ohms. The EEPOT is adjusted in 101-ohm increments. Incrementing UP increases the speaker audio volume.

Filtering and gain is provided by Op Amp U705A.

RELAY AND VOLTAGE REGULATOR

In addition to the control and latching circuits, the Logic Board contains a horn relay circuit, a + 5 volt voltage regulator and battery voltage filter.

Horn Relay

The horn relay circuit consists of NPN buffer transistor O702 and NPN relay driver transistor O703. The circuit is activated by the controller for a received call, when enabled by the EEPROM. The circuit is capable of handling up to 150 milliamperes to drive an external relay coil.

VoItage Regulator

Voltage regulator U712 supplies a regulated + 5 volts DC to all of the Logic Board ICs except for Op Amp U705. U705 is supplied by the filtered A +. A reset circuit is com-

bined with the regulator to provide the controller (via the modem chip) with a power-up signal for startup or restarts. The + 8 volts DC is supplied to U712 from 8-volt regulator U102 located on the RF Board.

Battery Voltage Filter

Transistor circuit Q704 operates as a filter circuit for the A + battery voltage. This circuit is used to reduce "alternator whine" interference. The filtered A + (13 Volts DC) is used on the Audio Board. Transistors Q708 and Q707 provide surge protection for Q704 by automatically shutting down if an over current condition is sensed at J701. Reset occurs when power is re-applied to the unit.

9600 AND 4800 BAUD OPERATION

For 4800 Baud operation, the jumper, P706, is installed on J706 pins 1 and 2. This enables the • 2 clock to the modem U708.

For 9600 Baud operation, the jumper, P706, is installed on J706 pins 2 and 3. This enables the crystal clock to modem U708.

LOGIC BOARD QUICK CHECKS

If a faulty Logic Board is suspected, it can be confirmed by substitution of a known good board.

DC CHECKS

Power for the Logic Board is supplied by the 8 volts on J702, Pin 3. This conies the + 8-Volt Regulator (U102) located on the RF Board.

- Check for $+5 \pm 0.25$ volts on U712, Pin 5. 1.
- 2. Check the Microcontroller Reset line (U701, Pin 10). If Reset is occurring, check the Regulator U705, Pin 2 and Q701. See Figure 2 for Reset Waveform.
- 3. Check for oscillator activity by examining the ALE clock on U701, Pin 33 (see Figure 3). If not present, examine the system clock on U701, Pin 20. The presence of a system clock but no ALE may indicate that U701 is defective. If the system clock is not present, check Y701 and related components.
- 4. All output lines from the Microcontroller are pulled to + 5 Volts through 50 K-Ohm resistors inside the Microcontroller. If a line is high, you may ground that pin and monitor the results. Service Note: If a line is low, the line may <u>not</u> be forced to +5 Volts.

PRODUCTION CHANGES

Changes in the equipment to improve performance or to simplify circuits are identified by a "Revision Letter", which is stamped after the model number of the unit. The revision stamped on the unit includes all previous revisions. Refer to the Parts List for the descriptions of parts affected by these revisions.

REV. A - <u>LOGIC BOARD 19D902151G3</u> To eliminate RF spare, capacitor C751 added. PWB revised to eliminate manual mode to board.

REV. B - <u>LOGIC BOARD 19D902151G3</u> To eliminate a clock slip problem U708 (19A704727P5) was replaced
