DESCRIPTION

The **R**adio **F**requency (**RF**) Power Amplifiers for the UHF **ORION**™ mobile radio are provided in three different frequency ranges and power levels designated as follows:

- 344A4573P1 (CAH-545EA) - 403-440 MHz, 20 WATT used in low power applications
  344A4573P2 (CAH-545EB) - 440-470 MHz, 20 WATT used in low power applications
- 344A4573P3 (CAH-545AL) - 403-440 MHz, 40 WATT used in mid power applications
  344A4573P4 (CAH-545BL) - 440-470 MHz, 40 WATT used in mid power applications
  344A4573P5 (CAH-545CL) - 470-512 MHz, 35 WATT used in mid power applications
- 344A4573P6 (CAH-545AH) - 403-440 MHz, 100 WATT used in high power applications
  344A4573P7 (CAH-545BH) - 440-470 MHz, 100 WATT used in high power applications
  344A4573P8 (CAH-545CH) - 470-512 MHz, 80 WATT used in high power applications

The exciter for each of the three power amplifiers is located on Synthesizer/Receiver/Exciter board CMN-354-1. This exciter circuit provides approximately 500 milliwatt input to the PA (refer to Maintenance Manual LBI- 39163). The PA utilizes a single power amplifier module (HC1) as the driver unit. In the case of the 20 watt amplifier the power module is the only power amplifying unit (Refer to Figure 1). With the other two power levels the power module drives other power transistors to provide the power output required (Refer to Figures 2 and 3). Each power amplifier is provided with an antenna switch and limiter circuit to isolate the receive circuit from the transmit circuit, limiting the receiver input from being over driven due to large RF signals. Each power amplifier has a power detect circuit which controls an **A**utomatic **P**ower **C**ontrol (**APC**) circuit to keep the power output constant. A low-pass filter is provided in the antenna circuit to reduce harmonic emissions. A keyed **Tx 9V** regulator is provided to power the APC circuits.

CIRCUIT ANALYSIS

20 WATT

The 20 Watt PA assembly uses one power module (HC1) to provide the output power.

Supply voltage for the power amplifier is connected from power leads on the System Interface Board to J3 (A+) and G (A-) on the PA Board. Diode CD7 is a surge protector to suppress pulses on the power leads. Diode CD8 will cause the fuse to blow if the polarity of the power leads is reversed.

The Exciter output is coupled through connector J151 on the Synthesizer/Receiver/Exciter Board to input connector J1 on the PA board. The 500 milliwatt RF input at J1 is coupled to power module HC1 through an attenuator pad consisting of resistors R1-R3. This pad attenuates the power to about 300 milliwatt and provides isolation between Exciter and PA. The power module (HC1) amplifies the 300 milliwatt input to 20 Watts.

The power module consists of a three-stage RF amplifier (Refer to **IC DATA**). The first stage power supply voltage is supplied by the power control circuit. The second and third stage power supply voltage is supplied by **SMOOTHING FILTER** transistor TR1. The second and third stage RF amplifiers operate as class C.

The 20 Watts output of HC1 is coupled to the **ANTENNA** and **ANTENNA SWITCH & LIMITER** circuits through 50 ohm stripline Z1.

Antenna Switch & Limiter

The Antenna Switch circuit consists of capacitor C25 and inductor L9 and takes the place of a quarter-wave micro strip line. When **TX9V** output goes high, bias current flows through switching diodes CD3 and CD4. A low impedance now exists at the anode of CD4 and a high impedance exists at the node connection of C25 and L9. This isolates the transmitter power from the receiver. Diode CD3 is now an RF short and along with capacitor C12, couples the power to the lowpass filter and on to the antenna.

The limiter circuit consists of transistors TR7, TR8 and diode package CD13. While receiving, if the received signal level exceeds +10 dBm, the rectified currents of CD13 provide forward bias to TR7, TR8 and PIN diode CD4 proportional to the received signal level. This causes a quarter-wave circuit (lumped constants C25 and L9) to turn on when the received signal exceeds +10 dBm and protects the receiver from excessively high receive signal levels.

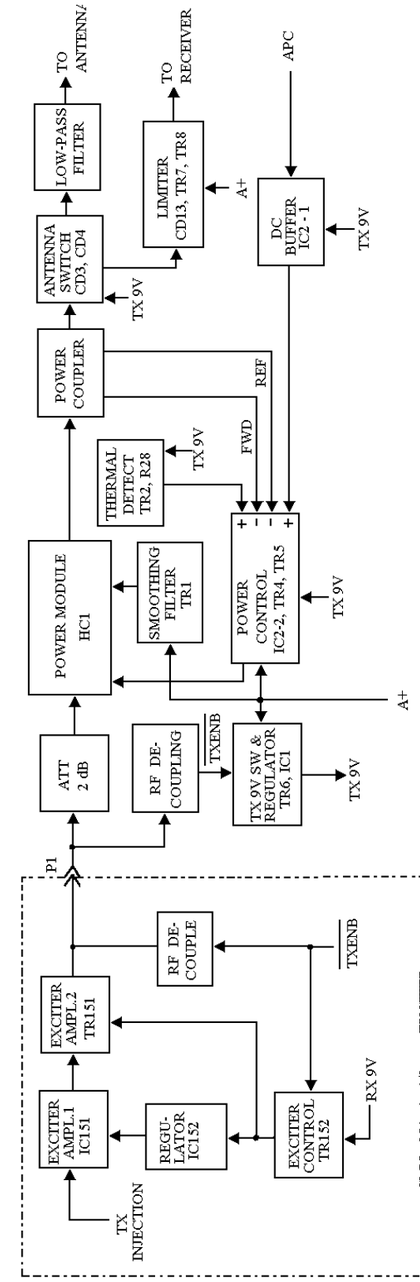

Figure 1 - 20-Watt Power Amplifier Block Diagram

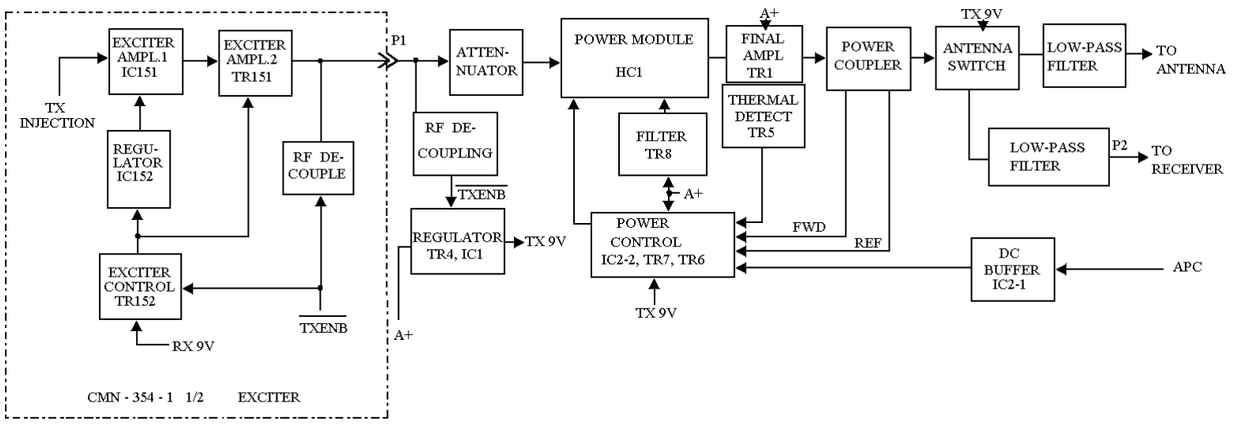

Figure 2 - 35/40-Watt Power Amplifier Block Diagram

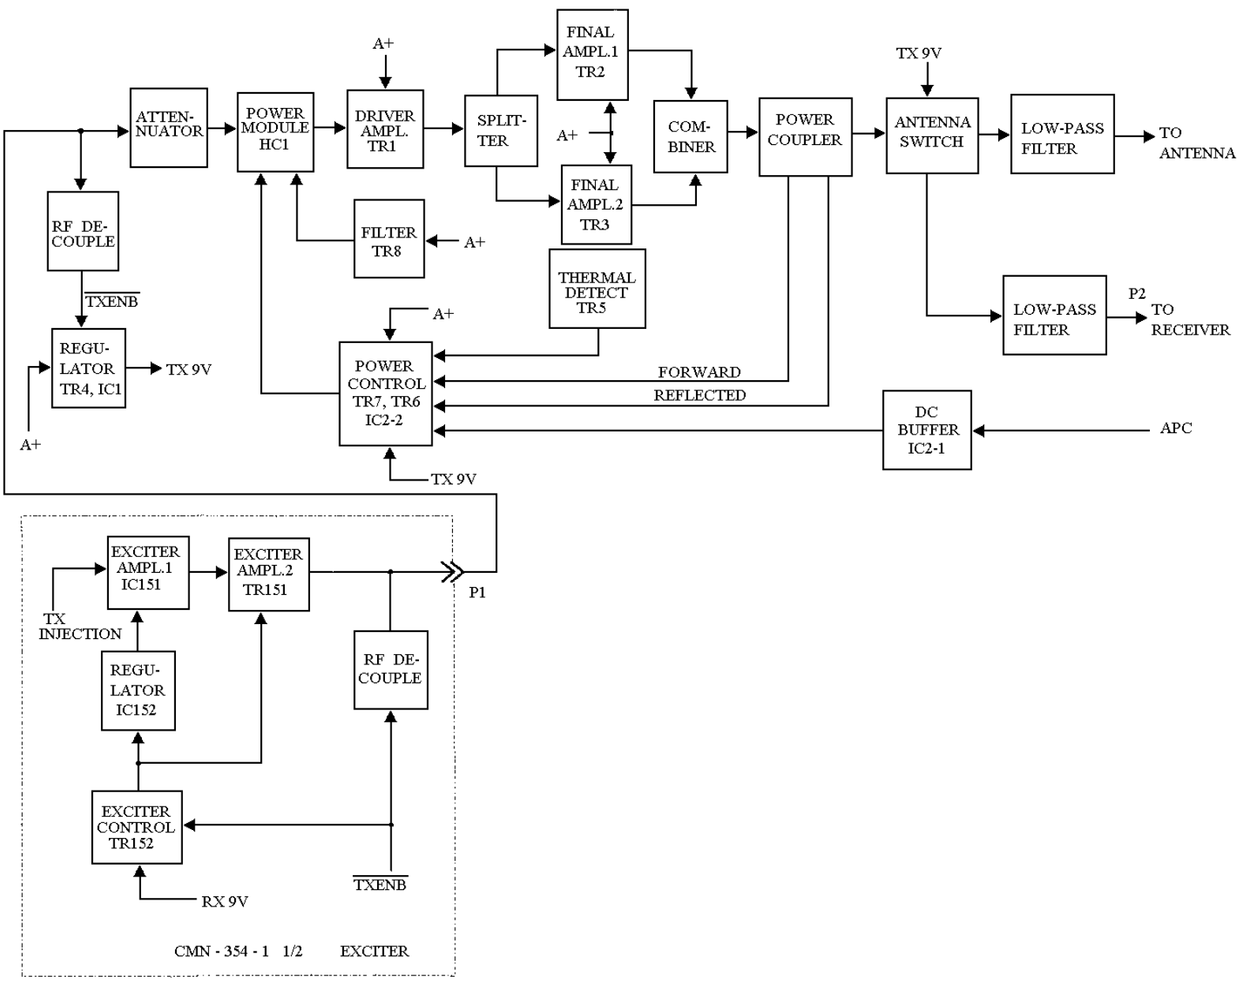

Figure 3 - 80/100 - Watt Power Amplifier Block Diagram

Tx 9V Switch

When the lead, located on the Synthesizer/Receiver/Exciter board, goes low, the DC voltage on J151 goes low. On the PA board, the DC voltage on J1 also goes low completing the circuit for diode CD9. With CD9 conducting TX 9V Switch transistor TR6 conducts applying A+ (13.32 V) to the input of +9 Volt Regulator IC1. The regulated +9 volts applies bias to operational amplifier IC2, transistor TR2 and switching diodes CD3 and CD4.

Power Control

The **A**uto **P**ower **C**ontrol (**APC**) circuit protects the transmitter PA from damage due to:

a. excessive output power

b. excessive reflected power

c. excessive temperature

The output power control circuit allows the RF output power to be set at rated power by the APC voltage from the Logic/IF/Audio Board. If the output power of the PA increases, the detected voltage and the input to operational amplifier IC2-2 increases. The output voltage of operational amplifier IC2-2 decreases. This causes **DC DRIVER** transistor TR5 to conduct less. This increases the base voltage on PNP **DC PASS** transistor TR4, causing it to conduct less. This results in less voltage being applied to the first amplifier stage in RF Power Module HC1, reducing the output power of the PA in proportion to the increases in output power detected by the circuit.

To protect the PA against badly mismatched loads, a reverse power detector circuit (**VSWR**) consisting of diode CD2, transistor TR5, operational amplifier IC2-2 and pass transistor TR4 detects reverse (reflected) power. When sufficient power is detected by CD2 to cause it to conduct, the voltage at the output of IC2-2 decreases, causing the Power Module to lower the output power, protecting the PA. The reverse power level is set by resistor R8 connected in series with diode CD2.

The PA is protected against temperature increases by a thermal detector circuit. This circuit consists of resistor R28, **THERMAL DETECT** transistor TR2, **DC DRIVER** transistor TR5 and **DC AMPL** operational amplifier IC2-2. As temperature increases, the resistance to ground through thermal detector resistor R28 increases. This causes IC2-2 to conduct less, causing a decrease in PA output until the temperature level is reduced. The temperature level is set by resistor R28. When the heatsink temperature rises above 90 C, the resistance of R28 increases and the power output is reduced.

35/40 WATT

The 35/40 Watt PA assembly uses one power module (HC1) and one RF power transistor (TR1) to provide the output power.

Supply voltage for the power amplifier is connected from power leads on the System Interface Board to J3 (A+) and G (A-) on the PA Board. Diode CD2 is a surge protector to suppress pulses on the power leads. (Diode CD1001 in the PA UNIT will cause a fuse to blow if the voltage polarity is reversed. Refer to the PA INTERCONNECTION DIAGRAM)

Test **P**oints (**TP**) are the printed board terminals for measuring control voltage as follows:

- TP1 A+ (13.42V)
- TP2 Control Voltage (4.72V)
- TP3 Forward Power Detect (2.64V)
- TP4 Tx 9V (9.12V)
- TP5 APC Voltage on output of DC AMPL IC2-1 (2.64V)
- TP6 Voltage to HC1, pins 3 &4 (12.5V)
- TP7 APC Voltage (3.5V)

The Exciter output is coupled through connector J151 on the Synthesizer/Receiver/Exciter Board to input Jack P1 on the PA board. The 500 milliwatt RF input at P1 is coupled to power module HC1 through an attenuator pad consisting of resistors R1-R4. This pad attenuates the 500 milliwatt to about 300 milliwatt and provides isolation between Exciter and PA. The power module (HC1) amplifies the 300 milliwatt input to 13 Watts.

The power module consists of a three-stage RF amplifier (Refer to IC DATA). The first stage power supply voltage is supplied by the power control circuit. The second and third stage power supply voltage is supplied by **SMOOTHING FILTER** transistor TR8. The second and third RF amplifiers operate as class C.

The 13 Watts output of HC1 is coupled to **POWER AMPL** transistor TR1 through impedance matching components consisting of capacitors C7, C9, C10 and inductor L2 through coupling capacitor C8. Transistor TR1 amplifies the 13 Watt level to 40 Watts. The output of TR1 is coupled to the **ANTENNA** and **ANTENNA SWITCH** through impedance matching components consisting of capacitors C11-C13, inductor L6 and impedance matching network Z2 through coupling capacitor C14 and 50 ohm stripline Z7.

Antenna Switch

The Antenna Switch circuit consists of capacitor C64 and inductor L23 and takes the place of a quarter-wave micro strip line. When **TX9V** output goes high, bias current flows through switching diodes CD5, CD7 and CD9. A low impedance now exists at the anode of CD7 and a high impedance exists at the connection of C64 and L23. This isolates the transmitter power from the receiver. Diode CD5 is now an RF short and along with capacitor C55 couples the power to the lowpass filter and on to the antenna.

Tx 9V Switch

When the **$\overline{\text{TX ENB}}$** lead goes low, TX 9V switch transistor TR4 conducts applying A+ (13.32 V) to the input of +9 Volt Regulator IC1. The regulated +9 volts (**TX 9V**) applies bias to operational amplifier IC2, transistor TR5 and switching diodes CD5, CD7 and CD9.

Power Control

The **A**uto **P**ower **C**ontrol (**APC**) circuit protects the transmitter PA from damage due to:

a. excessive output power

b. excessive reflected power

c. excessive temperature

The output power control circuit allows the RF output power to be set at rated power by the APC voltage from the Logic/IF/Audio Board. If the output power of the PA increases, the detected voltage and the input of operational amplifier IC2-2 increases. The output voltage of IC2-2 decreases. This causes **DC DRIVER** transistor TR6 to conduct less. This increases the base voltage on PNP **DC PASS** transistor TR7, causing it to conduct less. This results in less voltage being applied to the first amplifier stage in driver module (HC1), reducing the output power of the PA in proportion to the increases in output power detected by the circuit.

To protect the PA against badly mismatched loads, a reverse power detector circuit (**VSWR**) consisting of diode CD4, transistor TR6, operational amplifier IC2-2 and pass transistor TR7 detects reverse (reflected) power. When sufficient power is detected by CD4 to cause it to conduct, the voltage at the output of IC2-2 decreases, causing the driver module to lower the output power, protecting the PA. The reverse power level is set by resistor R15 connected in series with diode CD4.

The PA is protected against temperature increases by a thermal detector circuit. This circuit consists of resistor R49, transistors TR5, TR6, TR7 and operational amplifier IC2-2. As temperature increases, the resistance to ground through thermal detector resistor R49 increases. This causes IC2-2 to conduct less, causing a decrease in PA output until the temperature level is reduced. The temperature level is set by resistor R49. When the heatsink temperature rises above 90 C, the resistance of R49 increases and the power output is reduced.

80/100 WATT

The 80/100 Watt PA assembly uses one power module (HC1) and three RF power transistors (TR1, TR2 and TR3) to provide the output power.

Supply voltage for the power amplifier is connected from power leads on the System Interface Board to J3 (A+) and G (A-) on the PA Board. Capacitors C73 and C95 prevent RF from getting on the power leads. Diode CD1 causes a fuse to blow if the polarity of the power leads is reversed. Diode CD2 is a surge protector to suppress pulses on the power leads.

Test **P**oints (**TP**) are the printed board terminals for measuring control voltage as follows:

- TP1 A+ (13.32V)
- TP2 Control Voltage (4.27V)
- TP3 Forward Power Detect (3.2V)
- TP4 Tx 9V (9.2V)
- TP5 APC Voltage on output of DC AMPL IC2-1 (2.66V)
- TP6 Voltage to HC1, pins 3 &4 (12.8V)
- TP7 APC Voltage (3.5V)

The exciter output is coupled through connector J102 on the Synthesizer/Receiver/Exciter Board to input Jack P1 on the PA board. The 500 milliwatt RF input at P1 is coupled to power module HC1 through an attenuator pad consisting of resistors R1 through R4. This pad attenuates the 500 milliwatt input to 300 milliwatt and provides isolation between the Exciter and PA. **POWER MODULE** HC1 amplifies the 300 milliwatt input to 12 Watts. The power module (HC1) consists of a three stage RF amplifier. The first stage of the module is controlled by the voltage from the power control circuit. The amplifier consist of a Class C driver amplifier and two Class C common-emitter amplifiers. The 12 watt output is coupled to **DRIVER AMPL** transistor TR1 through impedance matching components consisting of capacitors C7, C9 C10, inductors L2 through L4 and coupling

capacitor C8. The output of TR1 is coupled to the power **SPLITTER** through the impedance matching components consisting of capacitors C11 through C13, C15, C96, C97, inductor L6 and impedance matching network Z1 through coupling capacitor C14. Transistor TR1 amplifies the 12 watt input level to 40 watts. The power splitter consists of capacitors C18, C27, C36 and Inductors L7 and L11. Resistor R5 absorbs any unbalance in the drive to **POWER AMPL-1**, **AMPL-2** transistors TR2 and TR3. These power amplifier stages consist of two identical paralleled Class C power amplifiers. The output of the power splitter is coupled to transistors TR2 and TR3 through coupling capacitors C19 and C28 and the impedance matching components consisting of capacitors C20, C21, C29 and C30. The output of TR2 and TR3 is coupled to the power combiner through impedance matching components consisting of capacitors C22-C25, C31-C34 and impedance matching networks Z2 and Z3. The power **COMBINER** consists of capacitors C26, C35, C40, C41 and inductors L10, L14 and L15. Resistor R8 absorbs the difference in the output power of TR2 and TR3. Transistors TR2 and TR3 each amplify the input level from 20 watts to about one-half (1/2) of the rated output power. The output of the combiner is coupled to the **ANTENNA SWITCH** through 50 ohm stripline Z7.

Antenna Switch

The antenna switch circuit consists of capacitor C64 and inductor L23 and takes the place of a quarter-wave micro strip line. When **TX9V** output goes high, bias current flows through switching diodes CD6 through CD9. A low impedance now exists at the anode of CD7 and CD8 and high impedance exists at the connection of C64 and L23. This isolates the transmitter power from the receiver. Diode CD6 is now an RF short and along with capacitor C55 couples the power to the lowpass filter and on to the antenna.

Tx 9V Switch

When the **$\overline{\text{TX ENB}}$** lead goes low, **TX 9V** switch transistor TR4 conducts applying A+ (13.32 V) to the input of +9 Volt Regulator IC1. The regulated +9 volts (**TX 9V**) applies bias to operational amplifier IC2, transistor TR5 and switching diodes CD6 through CD9.

Power Control

The Automatic Power Control (APC) circuit protects the transmitter PA from damage due to:

a. excessive output power

b. excessive reflected power

c. excessive temperature

The output power control circuit allows the RF output power to be set at rated power by the APC voltage from the LOGIC/IF/AUDIO Board. If the output power of the PA increases, the detected voltage and the input of operational amplifier IC2-2 increases. The output voltage of operational amplifier IC2-2 decreases. This causes transistor TR6 to conduct less. This increases the base voltage on PNP pass transistor TR7, causing it to conduct less. This results in less voltage being applied to the first amplifier stage in driver module (HC1), reducing the output power of the exciter/ PA in proportion to the increases in output power detected by the circuit.

To protect the PA against badly mismatched loads, a reverse power detector circuit (VSWR) consisting of diode CD4, transistor TR6, operational amplifier IC2-2 and pass transistor TR7 detect reverse (reflected) power. When sufficient power is detected by CD4 to cause it to conduct, the voltage at the output of IC2-2 decreases, causing the driver module to lower the output power, protecting the PA. The reverse power level is set by resistor R15 connected in series with diode CD4.

The PA is protected against temperature increases by a thermal detector circuit. This circuit consists of resistor R49, transistors TR5, TR6, TR7 and operational amplifier IC2-2. As temperature increases, the resistance to ground through thermal detector resistor R49 increases. This causes IC2-2 to conduct less, causing a decrease in PA output until the temperature level is reduced. The temperature level is set by resistor R49. When the heatsink temperature rises above 90 C, the resistance of R49 increases and the power output is reduced.

C64		Ceramic: 5 pF ±0.25pF 500 VDCW, temp coef 0±60 PPM. (Used in P3).
C64		Ceramic: 4 pF 0.25 pF 500 VDCW, temp coef 060 PPM. (Used in P4).
C64		Ceramic: 3 pF 0.25pF 500 VDCW, temp coef 0120 PPM. (Used in P5).
C64		Mica: 3 pF ±0.25pF 500 VDCW. (Used in P6).
C65		Ceramic: 6 pF ±0.5pF 500 VDCW, temp coef 0±60 PPM. (Used in P6).
C65		Ceramic: 5 pF ±0.5pF 500 VDCW, temp coef 0±60 PPM. (Used in P3).
C65		Ceramic: 4 pF ±0.25 pF 500 VDCW, temp coef 0±60 PPM. (Used in P4, P5, P7, P8).
C66		Ceramic: 4 pF ±0.25 pF 500 VDCW, temp coef 0±60 PPM. (Used in P3, P4, P7).
C66		Ceramic: 3 pF ±0.25pF 500 VDCW, temp coef 0±120 PPM. (Used in P5).
C66		Ceramic: 5 pF ±0.25pF 500 VDCW, temp coef 0±60 PPM. (Used in P8).
C67		Ceramic: 2 pF ±0.25 pF 50 VDCW, temp coef 0±30 PPM. (Used in P6, P7, P8).
C68		Ceramic: 100 pF ±5% 50 VDCW, temp coef 0±30 PPM.
C69		Ceramic: 100 pF ±5% 50 VDCW, temp coef 0±30 PPM.(Used in P6, P7, P8).
C71		Tantalum: 10 µF ±20%, 35 VDCW. (Used in P6, P7, P8).
C71		Tantalum: 10 µF ±20% 16 VDCW. (Used in P3, P4, P5).
C72		Electrolytic: 10 µF ±10%.
C73		Ceramic: 100 pF ±5% 500 VDCW, temp coef 0±60 PPM. (Used in P6, P7, P8).
C82		Ceramic: 100 pF ±5% 50 VDCW, temp coef 0±30 PPM.
C83		Tantalum: 1 µF ±20% 16 VDCW.
C84 thru C88		Ceramic: 100 pF ±5% 50 VDCW, temp coef 0±30 PPM.
C89		Ceramic: 0.1 µF ±5% 25 VDCW.
C90		Ceramic: 100 pF ±5% 50 VDCW, temp coef 0±30 PPM. (Used in P6, P7, P8).
C91		Tantalum: 4.7 µF ±10% 16 VDCW.
C92		Electrolytic: 100 µF ±20% 50 VDCW.
C93		Mica: 100 pF ±5% 500 VDCW.
C95		Electrolytic: 33 µF ±10% 25 VDCW.
C96		Ceramic: 18 pF ±5% 500 VDCW, temp coef 0±60 PPM. (Used in P6).
C96		Ceramic: 15 pF ±5% 500 VDCW, temp coef 0±60 PPM. (Used in P7, P8)
C97		Mica: 24 pF ±5% 100 VDCW. (Used in P8).
C98		Mica: 90 pF ±5% 500 VDCW. (Used in P6, P7, P8).
C99		Ceramic: 0.022 µF ±10% 50 VDCW, temp coef 0±30 PPM. (Used in P6).
C99		Ceramic: 100 pF ±5% 50 VDCW, temp coef 0±30 PPM. (Used in P3, P4, P5).
C151		Ceramic: 330 pF ±5% 50 VDCW, temp coef 0±30 PPM. (Used in P6, P7, P8, P3, P5)
C151		Ceramic: 7 pF ±0.5 pF 50 VDCW, temp coef 0±30 PPM. (Used in P4)
		---------- DIODES ----------
CD1		Silicon: fwd current 3A, 200 PIV; sim to MOTOROLA MR751. (Used in P6, P7, P8)
CD2		Ceramic: Varistor; sim to HOKURIKU 22ZR-10D.
CD3 and CD4		Diode: sim to PANASONIC MA741-TX.
CD5		Diode. (Used in P3, P4, P5).
CD6		Diode. (Used in P6, P7, P8).
CD7		Diode.
CD8		Diode. (Used in P6, P7, P8).
CD9		Diode.
CD10		Silicon: fast recovery (2 diodes in cathode common); sim to TOSHIBA 1SS184 TE85L.

SYMBOL	PART NO.	DESCRIPTION
CD11 and CD12	Note: Parts listed are for reference only. Refer to Service Section for serviceable parts.	Silicon: fast recovery, (RF Switch); sim to MITSUBISHI MI301.
HC1		RF Power Amplifier: sim to MITSUBISHI M57704M-38. (Used in P3, P6).
HC1		RF Power Amplifier: sim to MITSUBISHI M57704H-38. (Used in P4, P7).
HC1		RF Power Amplifier: sim to MITSUBISHI M57704SH-38. (Used in P5, P8).
IC1		Linear: Positive Voltage Regulator; sim to PANASONIC AN6541.
IC2		Linear, Dual OP Amp: sim to NEW JRC NJM3404AM.
J3		Connector.
J4		Connector.
L1		Coil.
L2		Coil. (Used in P3, P6, P7).
L2		Coil. (Used in P4, P5, P8).
L3		Coil.
L4		Coil.
L6		Coil. (Used in P6, P7, P8).
L6		Coil. (Used in P3).
L6		Coil. (Used in P4, P5).
L7		Coil. (Used in P6, P7, P8).
L8		Coil. (Used in P6, P7, P8).
L9		Coil. (Used in P6, P7, P8).
L10		Coil. (Used in P6, P7, P8).
L11		Coil. (Used in P6, P7, P8).
L12		Coil. (Used in P6, P7, P8).
L13		Coil. (Used in P6, P7, P8).
L14		Coil. (Used in P6, P7, P8).
L15		Coil. (Used in P6, P7).
L15		Coil. (Used in P8).
L17		Coil.
L18		Coil.
L19		Coil. (Used in P6, P7, P8).
L19		Coil. (Used in P3, P4, P5).
L20 and L21		Coil.
L22		Coil.
L23 and L24		Coil. (Used in P6, P7).
L23 and L24		Coil. (Used in P8).
L23		Coil. (Used in P3, P4, P5).
L24		Coil. (Used in P3, P4, P5).
L25		Coil. (Used in P6, P7, P8).
P1		Coaxial cable with connector. (Used in P3, P4, P5).
P1		Coaxial cable with connector. (Used in P6, P7, P8).
P2		Coaxial cable with connector. (Used in P3, P4, P5).
P2		Coaxial cable with connector. (Used in P6, P7, P8).
		----------RESISTORS ----------
R1		Metal film: 470 ohms ±5%, 100 VDCW 1/10W.
R2 and R3		Metal film: 22 ohms ±5%, 100 VDCW 1/10W.
R4		Metal film: 470 ohms ±5%, 100 VDCW 1/10W.
R5		Metal film: 24 ohms ±5%, 350 VDCW 3W. (Used in P6, P7, P8).
R6 and R7		Metal film: 3.3K ohms ±5%, 250 VDCW 1W. (Used in P6, P7, P8).
R8		Metal film: 24 ohms ±1%, 500 VDCW 1.5W. (Used in P6, P7, P8).
R10		Metal film: 82 ohms ±5%, 100 VDCW 1/8W. (Used in P6, P7, P8).
R10		Metal film: 68 ohms ±5%, 100 VDCW 1/10W. (Used in P3, P4, P5).
R11		Metal film: 120 ohms ±5%, 200 VDCW 1/8W. (Used in P6, P7, P8).
R11		Metal film: 82 ohms ±5%, 100 VDCW 1/10W. (Used in P3, P4, P5).
R12		Metal film: 120 ohms ±5%, 200 VDCW 1/8W. (Used in P6, P8).
R12		Metal film: 82 ohms 5%, 200 VDCW 1/8W. (Used in P7).
R12 and R13		Metal film: 100 ohms ±5%, 200 VDCW 1/10W. (Used in P3, P4, P5).
R13		Metal film: 820 ohms ±5%, 100 VDCW 1/8W. (Used in P6, P7, P8).

SYMBOL	PART NO.	DESCRIPTION
R14	Note: Parts listed are for reference only. Refer to Service Section for serviceable parts.	Metal film: 12k ohms ±5%, 100 VDCW 1/10W. (Used in P6).
R14		Metal film: 18k ohms ±5%, 100 VDCW 1/10W. (Used in P7).
R14		Metal film: 47k ohms ±5%, 100 VDCW 1/10W. (Used in P8).
R14		Metal film: 2.7k ohms ±5%, 100 VDCW 1/10W. (Used in P3, P4,P5).
R15		Metal film: 100 ohms ±5%, 100 VDCW 1/10W.
R16		Metal film: 1.5K ohms ±5%, 100 VDCW 1/10W. (Used in P6).
R16		Metal film: 3.9K ohms ±5%, 100 VDCW 1/10W. (Used in P7).
R16		Metal film: 4.7K ohms ±5%, 100 VDCW 1/10W. (Used in P8).
R16		Metal film: 1K ohms ±5%, 100 VDCW 1/10W. (Used in P3, P4, P5).
R17 and R18		Metal film: 120 ohms ±5%, 250 VDCW 1W. (Used in P6, P7, P8).
R17 and R18		Metal film: 180 ohms ±5%, 250 VDCW 1W. (Used in P3, P4, P5).
R19		Metal film: 47K ohms ±5%, 200 VDCW 1/4W.
R20		Metal film: 4.7K ohms ±5%, 100 VDCW 1/10W.
R21		Metal film: 680 ohms ±5%, 200 VDCW 1/4W.
R35		Metal film: 10K ohms ±5%, 100 VDCW 1/10W.
R36		Metal film: 3.3K ohms ±5%, 100 VDCW 1/10W. (Used in P6).
R36		Metal film: 1.8K ohms ±5%, 100 VDCW 1/10W. (Used in P7, P8).
R36		Metal film: 2.2K ohms ±5%, 100 VDCW 1/10W. (Used in P3, P4, P5).
R37		Metal film: 1.8K ohms ±5%, 100 VDCW 1/10W. (Used in P3, P6).
R37		Metal film: 2.2K ohms ±5%, 100 VDCW 1/10W. (Used in P7).
R37		Metal film: 1.5K ohms ±5%, 100 VDCW 1/10W. (Used in P4).
R37		Metal film: 1.2K ohms ±5%, 100 VDCW 1/10W. (Used in P5, P8).
R38		Metal film: 10K ohms ±5%, 100 VDCW 1/10W. (Used in P7).
R39		Metal film: 2.7K ohms ±5%, 100 VDCW 1/10W. (Used in P6, P7, P3, P4, P5).
R39		Metal film: 2.2K ohms ±5%, 100 VDCW 1/10W. (Used in P8).
R40		Metal film: 27K ohms ±5%, 100 VDCW 1/10W.
R41		Metal film: 2.2K ohms ±5%, 100 VDCW 1/10W.
R42		Metal film: 47K ohms ±5%, 100 VDCW 1/10W.
R43		Metal film: 1K ohms ±5%, 100 VDCW 1/10W.
R44 and R45		Metal film: 820 ohms ±5%, 100 VDCW 1/10W.
R46 and R47		Metal film: 470 ohms ±5%, 100 VDCW 1/10W.
R48		Metal film: 10 ohms ±5%, 200 VDCW 1/8W.
R49		Polyester: sim to MURATA PTH9M04BC222TS2F333.
R50		Metal film: 100K ohms ±5%, 100 VDCW 1/10W.
R52		Metal film: 50 ohms ±5%, 100 VDCW 10W.
RV1		Variable:
		---------- TRANSISTOR ----------
TR1		Silicon, NPN: sim to MITSUBISHI 2SC3102.
TR2 and TR3		Silicon, NPN: sim to MITSUBISHI 2SC4989. (Used in P6, P7, P8).
TR4		Silicon, PNP: sim to NEC 2SB624-T1B BV3.
TR5 and TR6		Silicon, PNP: sim to NEC 2SB596-T1B DV3.
TR7		Silicon PNP: sim to PANASONIC 2SB953A.
TR8		Silicon NPN: sim to PANASONIC 2SD1271-Q.
W1		Jumper wire: (Used in P6, P7, P8)
W3		Jumper wire: (Used in P6, P7, P8)

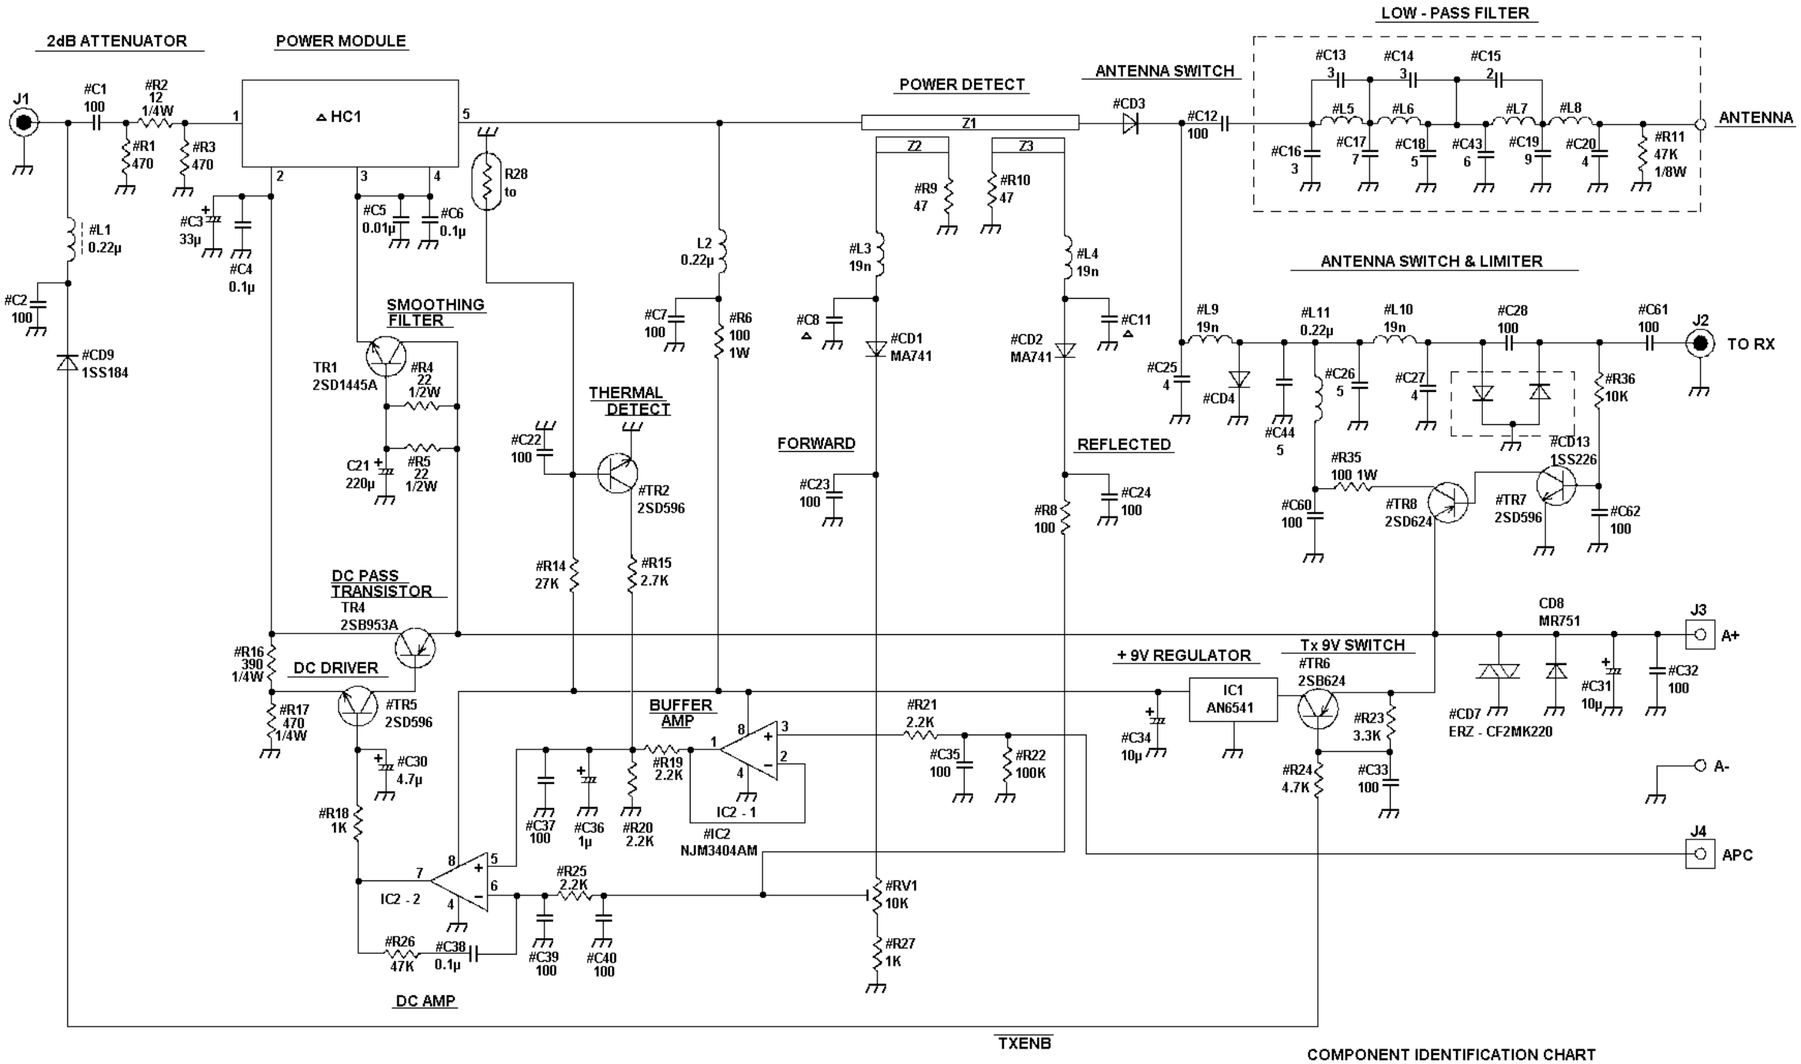
(19B/6PCLD00281D, Solder Side)



NOTES:
1. "#" IDENTIFIES CHIP COMPONENTS (EXAMPLE #R12 OR R12#) WHICH ARE LOCATED ON THE COMPONENT SIDE OF THE BOARD.
2. Z1, Z2 AND Z3 ARE STRIPLINE PART OF PWB.
3. RV1 IS FACTORY TUNED AND DOES NOT REQUIRE FURTHER ADJUSTMENT.

ALL RESISTORS ARE 1/10 OR 1/8 WATT UNLESS OTHERWISE SPECIFIED.
RESISTOR VALUES IN Ω UNLESS FOLLOWED BY MULTIPLIER K OR M.
CAPACITOR VALUES IN P UNLESS FOLLOWED BY MULTIPLIER µ.
INDUCTANCE VALUES IN H UNLESS FOLLOWED BY MULTIPLIER m OR µ.

DC VOLTAGE READINGS

ALL VOLTAGES ARE TYPICAL. VOLTAGES ARE MEASURED WITH A 10Meg OHM PER VOLT METER. REFERENCE TO GROUND. VOLTAGE READINGS ARE TAKEN WITH THE TRANSMITTER UNKEYED/KEYED. EX .45 (UNKEYED)/ .05 (KEYED).
