Repeater-Builder's notes on getting (and staying) in the bootloader mode of an STM32-DVM board

Pi-Star has changed the way it runs MMDVMHost. It *REALLY* wants to start it up. This should stop it in its tracks:

1. Boot Pi-Star
2. login (Default -> usr: pi-star - pass: raspberry)
3. Issue the following commands:
   - …:~$ `sudo -s`
   - …:~$ `rpi-rw`
   - …:~$ `cd /etc`
   - …:~$ `mv mmdvmhost mmdvmhost.save`
   - …:~$ `poweroff`
4. put board in bootloader (short JP1 pins)
5. power on Rasperry Pi
6. get utilities and source code / Program DVM board
   (See: https://github.com/N4IRS/MMDVM-Install/tree/master/STM32-DVM)
7. Issue the following commands:
   - … :~$ `rpi-rw`
   - … :~$ `cd /etc`
   - … :~$ `mv mmdvmhost.save mmdvmhost`
   - … :~$ `poweroff`
8. remove jumper
9. power on Rasperry Pi – The board should boot normally
