SAFETY INFORMATION

The United States Department of Labor, through the provisions of the occupational Safety and Health Act of 1970 (OSHA), has established an electromagnetic radiation safety standard which applies to this equipment. Normal use of this radio will result in exposures far below the OSHA limit. However, the following precautions are recommended:

DO NOT approach the antenna closer than four inches for omni-directional antennas or four feet for all other antennas when the transmitter is operative.

DO NOT operate the transmitter unless all rf connectors are secure and any open connectors are properly terminated with a leakproof load.

NEPS-21233-O

VHF FLEXAR SPECIFICATIONS

GENERAL

FREQUENCY RANGE	136-174 MHz
DIMENSIONS	4.06"H x 13.07"W x 13.74"D (103mm x 332mm x 349mm)
WEIGHT	17.5 lbs (7.94 kgs)

TRANSMITTER

RF POWER OUTPUT	25 Watts (136-174 MHz)
SPURIOUS & HARMONIC EMISSIONS*	60 dB below carrier
OUTPUT IMPEDANCE	50 ohms
FREQUENCY STABILITY	±0.0005%; -30°C to +60°C (+25°C reference)
MODULATION	16F3
AUDIO SENSITIVITY	160 mV ±3 dB for 3.0 kHz deviation at 1000 Hz
FM HUM & NOISE	-55 dB below ±3.0 kHz deviation at 1000 Hz
AUDIO RESPONSE	+1, -3 dB from 6 dB/octave pre-emphasis (300 to 3000 Hz)
AUDIO DISTORTION	Less than 3%

*Per EIA specification RS-152B, paragraph 4.

RECEIVER

CHANNEL SPACING	30 kHz
SELECTIVITY - EIA SINAD	-90 dB @ ±30 kHz
INTERMODULATION-EIA SINAD	-85 dB
EIA MODULATION ACCEPTANCE	7 kHz
SENSITIVITY	.50 uV or less for 20 dB quieting .35 uV or less for EIA Sinad
FREQUENCY STABILITY	±0.0005%; -30°C to +60°C (+25°C reference)
SPURIOUS AND IMAGE REJECTION	Greater than 100 dB
SQUELCH THRESHOLD SENSITIVITY	Less than 0.2 uV
AUDIO OUTPUT	Line: +11 dBm with less than 3% distortion Speaker: 3 watts with less than 5% distortion
AUDIO RESPONSE	Line: +1, -3 dB from 6 dB/octave de-emphasis (300-3000 kHz) Speaker: +2, -8 dB from 6 dB/octave de-emphasis (300-3000 kHz)
HUM AND NOISE (UNSQUELCHED)	Speaker: -50 dB from full rated output Line: -45 dB from full rated output

POWER SUPPLY

AC REQUIREMENTS	100,120,220,240 V ac ±20% 50/60 Hz
DC OUTPUT	13.8 V dc nominal

Specifications subject to change without notice.

UHF FLEXAR SPECIFICATIONS

GENERAL

FREQUENCY RANGE	406-420 MHz, 450-512 MHz
DIMENSIONS	4.06"H x 13.07"W x 13.74"D (103mm x 332mm x 349mm)
WEIGHT	17.5 lbs (7.94 kgs)

TRANSMITTER

RF POWER OUTPUT	30 Watts (450-470 MHz), 25 Watts (470-512 MHz), 15 Watts (406-420 MHz), 15 Watts (450-512 MHz), 2 Watts (450-512 MHz)
SPURIOUS & HARMONIC EMISSIONS*	70 dB below carrier (450-512 MHz), 65 dB below carrier (406-420 MHz)
OUTPUT IMPEDANCE	50 ohms
FREQUENCY STABILITY	± 0.0005%; -30°C to +60°C (+25°C reference) ± 0.0002% (Optional) Except 406-420 MHz
MODULATION	16F3
AUDIO SENSITIVITY	160 mV ± 3 dB for 3.0 kHz deviation at 1000 Hz
FM HUM & NOISE	-55 dB below ± 3.0 kHz deviation at 1000 Hz
AUDIO RESPONSE	+1, -3 dB from 6 dB/octave pre-emphasis (300 to 3000 Hz)
AUDIO DISTORTION	Less than 3%

*Per EIA specification RS-152B, paragraph 4.

RECEIVER

CHANNEL SPACING	25 kHz
SELECTIVITY - EIA SINAD	-85 dB @ ± 25 kHz, -75 dB (406-420 MHz)
INTERMODULATION-EIA SINAD	-80 dB, -75 dB (406-420 MHz)
EIA MODULATION ACCEPTANCE	7 kHz (6.5 kHz, 406-420 MHz)
SENSITIVITY	0.40 uV or less for 20 dB quieting 0.3 uV or less for EIA Sinad
FREQUENCY STABILITY	± 0.0005%; -30°C to +60°C (+25°C reference)
SPURIOUS AND IMAGE REJECTION	Greater than 100 dB, 85 dB (406-420 MHz)
SQUELCH THRESHOLD SENSITIVITY	Less than 0.2 uV
AUDIO OUTPUT	Line: +11 dBm with less than 3% distortion Speaker: 3 watts with less than 5% distortion
AUDIO RESPONSE	Line: +1, -3 dB from 6 dB/octave de-emphasis (300-3000 kHz) Speaker: +2, -8 dB from 6 dB/octave de-emphasis (300-3000 kHz)
HUM AND NOISE (UNSQUELCHED)	Speaker: -50 dB from full rated output Line: -45 dB from full rated output

POWER SUPPLY

AC REQUIREMENTS	100,120,220,240 V ac ± 20% 50/60 Hz
DC OUTPUT	13.8 V dc nominal

Specifications subject to change without notice.

800 MHz FLEXAR SPECIFICATIONS

GENERAL

FREQUENCY RANGE	TX 806-821 MHz; RX 851-866 MHz
DIMENSIONS	4.06"H x 13.07" W x 13.74" D (103mm x 332mm x 349mm)
WEIGHT	17.5 lbs. (7.94 kgs)

TRANSMITTER

RF POWER OUTPUT	10 Watts (806-821 MHz)
SPURIOUS & HARMONIC EMISSIONS*	56 dB below carrier
OUTPUT IMPEDANCE	50 ohms
FREQUENCY STABILITY	± .00025%; -30°C to + 60°C (+ 25°C reference)
MODULATION	16F3, 15F2, 16F9
AUDIO SENSITIVITY	160 mV ± 3 dB for 3.0 kHz deviation at 1000 Hz
FM HUM & NOISE	-50 dB below ± 3.0 kHz deviation at 1000 Hz
AUDIO RESPONSE	+ 1, 3 dB for 6 dB/octave pre-emphasis (300 to 3000 Hz)
AUDIO DISTORTION	Less than 3%

*Per EIA specification RS-152B, paragraph 4.

RECEIVER

CHANNEL SPACING	25 kHz
SELECTIVITY-EIA SINAD	-70 dB @ ± 25 kHz
INTERMODULATION-EIA SINAD	-70 dB
EIA MODULATION ACCEPTANCE	7 kHz
SENSITIVITY	.40 uV or less for 20 dB quieting .30 uV or less for EIA Sinad
FREQUENCY STABILITY	± .00025%; -30°C to + 60°C (+ 25°C reference)
SPURIOUS AND IMAGE REJECTION	Greater than 80 dB
SQUELCH THRESHOLD SENSITIVITY	Less than 0.2 uV
AUDIO OUTPUT	Line: + 11 dBm with less than 3% distortion Speaker: 3 watts with less than 5% distrotion
AUDIO RESPONSE	Line: + 1, -3 dB from 6 dB/octave de-emphasis (300-3000 kHz) Speaker: + 2, -8 dB from 6 dB/octave de-emphasis (300-3000 kHz)

POWER SUPPLY

HANDLING PRECAUTIONS FOR CMOS INTEGRATED CIRCUITS

Many of the integrated circuit devices used in communications equipment are of the CMOS (Complementary Metal Oxide Semiconductor) type. Because of their high open circuit impedance, CMOS ICs are vulnerable to damage from static charges. Care must be taken in handling, shipping, and servicing them and the assemblies in which they are used.

Even though protection devices are provided in CMOS IC inputs, the protection is effective only against overvoltage in the hundreds of volts range such as are encountered in an operating system. In a system, circuit elements distribute static charges and load the CMOS circuits, decreasing the chance of damage. However, CMOS circuits can be damaged by improper handling of the modules even in a system.

To avoid damage to circuits, observe the following handling, shipping, and servicing precautions:

(1) Prior to and while servicing a circuit module, particularly after moving within the service area, momentarily touch both hands to a bare metal earth grounded surface. This will discharge any static charge which may have accumulated on the person doing the servicing.

(2) Whenever possible avoid touching any electrically conductive parts of the circuit module with your hands.

(3) Normally, circuit modules can be inserted or removed with power applied to the unit. However, check the INSTALLATION and MAINTENANCE sections of the manual as well as the module schematic diagram to insure there are no objections to this practice.

(4) When servicing a circuit module, avoid carpeted areas, dry environments, and certain types of clothing (silk, nylon, etc.) because they contribute to static buildup.

(5) All electrically powered test equipment should be grounded. Apply the ground lead from the test equipment to the circuit module before connecting the test probe. Similarly, disconnect the test probe prior to removing the ground lead.

(6) If a circuit module is removed from the system, it is desirable to lay it on a conductive surface (such as a sheet of aluminum foil) which is connected to ground through a resistance of approximately 100k.

WARNING

If the aluminum foil is connected directly to ground, be cautious of possible electrical shock from contacting the foil at the same time as other electrical circuits.

(7) When soldering, be sure the soldering iron is grounded.

(8) Prior to connecting jumpers, replacing circuit components, or touching CMOS pins (if this becomes necessary in the replacement of an integrated circuit device), be sure to discharge any static buildup as described in procedure 1. Since voltage differences can exist across the human body, it is recommended that only one hand be used if it is necessary to touch pins on the CMOS device and associated board wiring.

(9) When replacing a CMOS integrated circuit device, leave the device in its metal rail container or conductive foam until it is to be inserted into the printed circuit module.

(10) All low impedance test equipment (such as pulse generators, etc.) should be connected to CMOS device inputs after power is applied to the CMOS circuitry. Similarly, such low impedance equipment should be disconnected before power is turned off.

(11) Replacement modules shipped separately from the factory will be packaged in a conductive material. Any modules being transported from one area to another should be wrapped in a similar material (aluminum foil may be used). NEVER USE NONCONDUCTIVE MATERIAL for packaging these modules.

INSTALLATION AND ADJUSTMENTS

1. PRE-OPERATIONAL INSTRUCTIONS

1.1 When unpacking the radio from its shipping carton, refer to the model chart at the front of this manual. If any item is missing, contact your Motorola representative immediately.

1.2 FCC regulations state that a station license must be obtained for each radio installation by the owner of the equipment. The station licensee is responsible for ensuring that the transmitter power, frequency, and deviation are within the limits permitted under the station license. Adjustments to the transmitter section of the radio may be made only by a technician possessing an FCC commercial radiotelephone operator's license. No license is required to install, check out, or operate the radio.

1.3 Each radio set is adjusted, tested, and inspected before shipment. However, it is recommended that both the transmitter and receiver sections of the radio be checked for proper operation just prior to installation.

1.4 The radio should be tested with all cables and accessories supplied with the radio connected as they will be in the final installation. The frequency, deviation, and output power of the transmitter should be checked, as well as the sensitivity, squelch operation, and audio quality of the receiver. Radios with "Private-Line" (PL) or "Digital Private-Line" (DPL) coded squelch capabilities should be operated in that mode to verify proper encode/decode performance. In planning the installation, keep the antenna cable run as short as possible and provide a 117 V AC grounded 3-wire convenience outlet within reach of the AC cord. Connect the antenna cable to the antenna jack on the rear of the station and plug in the AC cord.

1.5 The screw terminals located on the bottom of the radio are used for DC remote control connections, paging, and optional microphone connections. Refer to Figure 1, Table 1 and Table 2 for connections.

GND	Black

NOTE

JU1 is in on the TMN1005AV Microphone.

Table 2. Paging and DC Remote Control Connections

Figure 1 Reference	Function
PAGE	Paging PTT
MIC HI	Paging Tone Input
MIC LO	Paging Ground
LINE +	DC Remote Control Input
LINE-	DC Remote Control Input

NOTE

When interfacing external equipment with the FLEXAR Base Station, refer to the applicable instruction manual for the equipment being used.

NOTE

If outside transmission lines are used for the remote control lines, spark gaps should be placed where the line enters the building. A spark gap should be connected between each side of the line and ground.

2. SERVICING

2.1 HOUSING REMOVAL

Step 1. Remove the four screws on the bottom of the station that are used to secure the housing.

Step 2. Press gently inward on both sides of the station housing and lift the housing off the radio chassis.

2.2 RF SECTION REMOVAL

The rf section folds outward on a hinge for ease of servicing. It can be folded outward by removing the three screws that secure the rf chassis to the station chassis near the power supply. Also, the heatsink for the power amplifier folds down when the screw from the rear of the heatsink is removed.

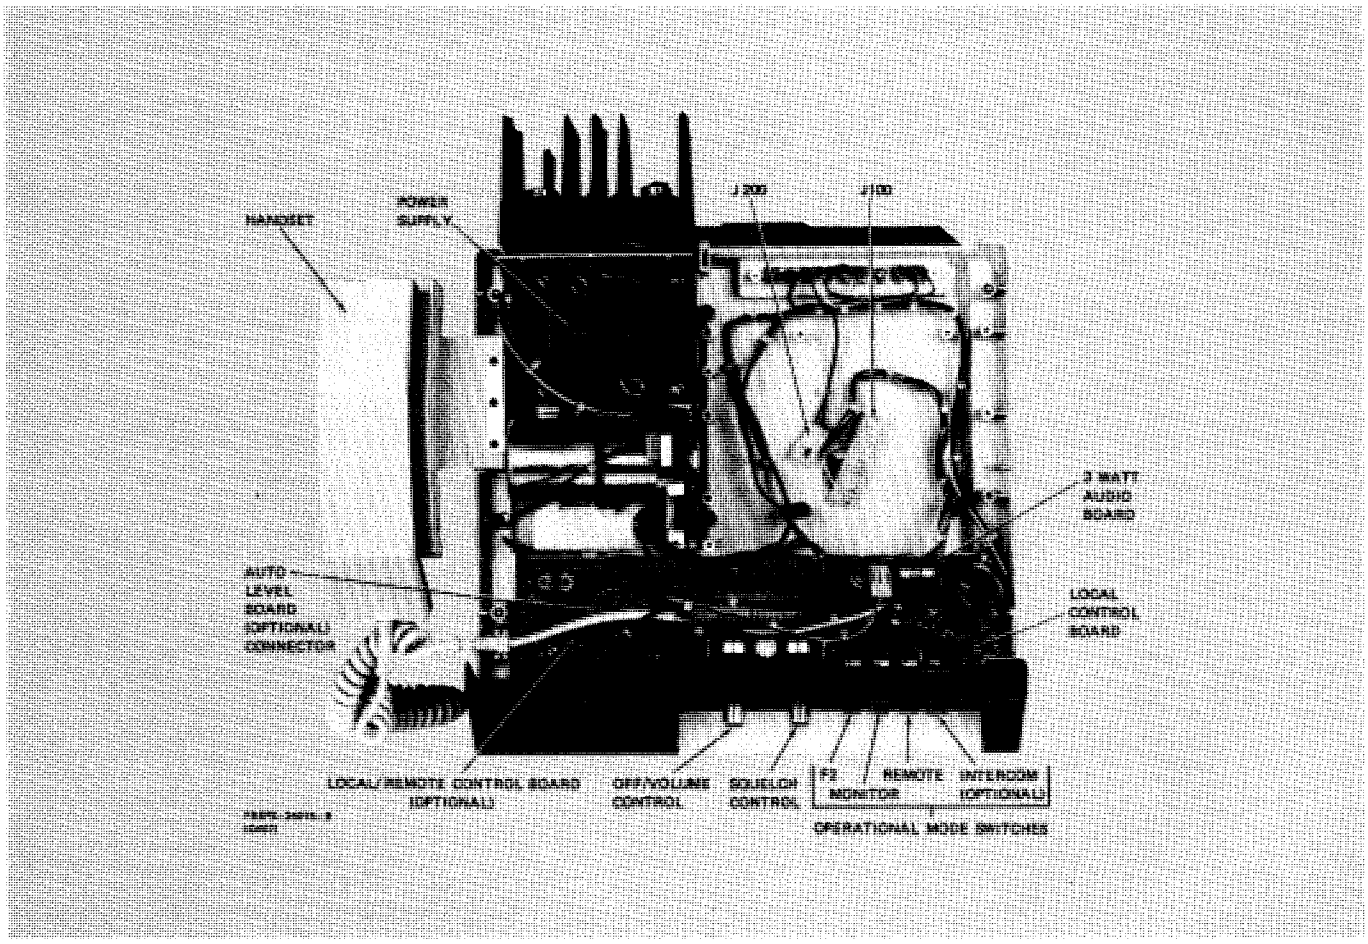

Figure 2. Circuit Board Location

2.3 POWER SUPPLY REMOVAL

Step 1. Remove the three screws securing the handset cradle to the housing.

Step 2. Remove the four screws securing the power supply to the housing.

Step 3. Remove the power supply by lifting upward.

Step 4. Remove the two screws securing the heatsink. The heatsink folds out for servicing.

2.4 CIRCUIT BOARD REMOVAL

To facilitate the removal of circuit boards, the rf section should be folded out and the power supply removed. When removing the local board, the volume and squelch knobs located on the FLEXAR front panel must be removed. The boards are then removed by unscrewing the captive screws that secure the boards to the chassis.

NOTE

On the circuit boards where a polarized capacitor is used, an arrow is shown pointing toward the marked side of the capacitor, which is not necessarily the positive lead.

2.5 SERVICING PROCEDURES

2.5.1 When servicing local or local/remote model receiver sections, move JU11 (on the local control board) from pin N (normal) to pin T (test). This allows frequency selection using the F2 switch without keying the transmitter.

2.5.2 When servicing the receiver section of dc remote control models, the jumper labeled LIN DIS (line disable) should be repositioned to the DIS pin. Frequency selection is accomplished by repositioning the REM (remote) jumper to the desired frequency pin.

CAUTION

When servicing the receiver section, the transmit crystals should be removed to prevent damage to the signal generator due to accidental keying of the radio.

3. PREOPERATIONAL ADJUSTMENTS

3.1 Insure that all external equipment (remote control units, paging units, etc.), if used, is properly connected and functioning correctly. Refer to the receiver and transmitter alignment procedures for the general test procedures. On two-frequency models the tests should be performed on both frequencies. For "Private-Line" or "Digital Private-Line" models check operation, where applicable, with and without coded squelch.

3.2 The following general tests may be used to verify proper operation of the FLEXAR base station.

1. Power Output
2. Transmitter Frequency
3. Transmitter Deviation
4. 20 dB Receiver Quieting
5. VSWR (If greater than 3:1, check the antenna installation.)
6. Squelch operation (PL and DPL encode/decode operation.)

3.3 In addition to the previous tests, line level and remote control operation checks should also be performed.

NOTE

Radios are shipped with the input and output line levels set for 0 dBm.

NOTE

On radios with the automatic line level adjust option it is extremely important that all remote control units are connected during line level adjustments.

4. LINE LEVEL SETTING

NOTE

On local/remote models the REMOTE BUTTON located on the front panel of the FLEXAR station MUST BE ENABLED (IN) to allow remote control operation.

4.1 LEVEL SETTING FOR LOCAL/REMOTE MODELS

4.1.1 Local/Remote Models Without Automatic Line Level Option

Step 1. Insure that the remote control units are properly connected and the radio is operating correctly.

Step 2. Apply a 1000 uV on-frequency signal with modulation of 1 kHz at ± 3 kHz deviation at the antenna input.

Step 3. Depress MONITOR switch in front panel.

Step 4. Connect an ac voltmeter across the LN+ and LN- terminals on the radio.

Step 5. Adjust the line level control labeled RL on the local/remote board for 0 dBm as indicated on the meter.

Step 6. Disconnect the rf signal generator and connect a suitable dummy load to the antenna connector.

Step 7. Connect a 1 kHz audio oscillator across the LN+ and LN- terminals and adjust for 0 dBm.

Step 8. On local/remote stations, ground the pin labeled TEST on the local/remote board. This step keys the transmitter.

Step 9. Adjust the exciter level control labeled EX for a level 6 dB above the modulation sensitivity level (± 3 kHz deviation).

NOTE

Modulation sensitivity level + 6 dB is 6 dB above the level required for ± 3 kHz deviation. If a deviation monitor is not available, 320 mV at P100-6 will approximate the level required.

Step 10. Remove the ground connected in Step 8.

Step 11. Apply 160 mV, 1 kHz signal to P100-6 and adjust microphone level control ML (R20) on the local remote board for the same level as the receiver line level set in Step 5.

NOTE

For all local/remote model FLEXAR base stations which do not use the automatic line level adjustment option, it is imperative that the receive output line level and the incoming line level from the remote controlling point be the same. For example, if due to path loss, the incoming level from the control point is -10 dBm, the receiver output level should be also sent -10 dBm at the base station.

4.1.2 Local/Remote Models With Automatic Line Level Option

Step 1. Insure that JU2 is cut on the local/remote board.

NOTE

Most systems use a receiver line output level of 0 dBm although + 11 dBm can also be used (if allowable on transmission line). For 0 dBm, JU1 and JU2 on the TRN6822A Auto Level Board are in; JU1 and JU2 are out for + 11 dBm systems. Also insure that all but one of the remote control units are connected in a line bridging mode.

Step 2. Insure that the remote control units are properly connected and the radio is operating correctly.

Step 3. Apply a 1000 uV on-frequency signal with modulation of 1 kHz at ± 3 kHz deviation at the antenna input.

Step 4. Depress MONITOR switch in front panel.

Step 5. Connect an ac voltmeter across the LN+ and LN- terminals on the radio.

Step 6. Adjust the line level control labeled RL on the local/remote board for 0 dBm as indicated on the meter.

Step 7. Disconnect the rf signal generator and connect a suitable dummy load to the antenna connector.

Step 8. Connect a 1 kHz audio oscillator across the LN+ and LN- terminals and adjust for 0 dBm.

Step 9. On local/remote stations ground the pin labeled TEST on the local/remote board. This step keys the transmitter.

Step 10. Adjust the exciter level control labeled EX for a level 6 dB above the modulation sensitivity level (± 3 kHz deviation).

NOTE

Modulation sensitivity level + 6 dB is 6 dB above the level required for ± 3 kHz deviation. If a deviation monitor is not available, 320 mV at P100-6 will approximate the level required.

Step 11. Remove the ground connected in Step 9.

Step 12. Apply 160 mV, 1 kHz signal to P100-6 and adjust microphone level control ML (R20) on the local remote board for the same level as the receiver line level set in Step 6.

NOTE

Steps 13 and 14 are required only for systems where the path loss between the control point and the station is greater than 15 dB.

Step 13. For local/remote stations connect an audio oscillator (160 mV, 1 kHz) to P100-6 and an ac voltmeter to the pin labeled "A" on the TRN6822A Auto Level Board. Adjust the microphone level control R20 on local/remote board for a maximum dip in amplitude at pin "A".

Step 14. Connect an ac voltmeter to the control line (1 kHz). If JU1 and JU2 are in (on the TRN6822A Auto Level Board) the ac voltmeter reading should be 0 dBm ± 2 dB; if JU1 and JU2 are out, the reading should be ± 11 dBm ± 2 dB.

4.2 LEVEL SETTING FOR DC REMOTE CONTROL MODELS

4.2.1 DC Remote Control Models Without Automatic Line Level Option

Step 1. Insure that the remote control units are properly connected and the radio is operating properly.

Step 2. Apply a 1000 uV on-frequency signal with modulation of 1 kHz at ± 3 kHz deviation at the antenna input.

Step 3. Slide PL MON ← switch on dc remote board in direction of arrow.

Step 4. Connect an ac voltmeter across the LN+ and LN- terminals on the radio.

Step 5. Adjust the line level control labeled LINE on the dc remote board for 0 dBm as indicated on the meter.

Step 6. Disconnect the rf signal generator and connect a suitable dummy load to the antenna connector.

Step 7. Connect a 1 kHz audio oscillator across the LN+ and LN- terminals and adjust for 0 dBm.

Step 8. Actuate the PTT switch on the service handset. This step keys the transmitter.

Step 9. Adjust the exciter level control labeled XMIT for a level 6 dB above the modulation sensitivity level (± 3 kHz deviation).

NOTE

Modulation sensitivity level + 6 dB is 6 dB above the level required for ± 3 kHz deviation. If a deviation monitor is not available, 320 mV at P100-6 will approximate the level required.

Step 10. Release handset PTT.

Step 11. Apply 160 mV, 1 kHz signal to P100-6 and adjust R32 for the same level as the receiver line level set in Step 5.

4.2.2 DC Remote Control Models With Automatic Line Level Option

Step 1. Insure that JU6 is cut on the dc remote board.

NOTE

Most systems use a receiver line output level of 0 dBm although + 11 dBm can also be used (if allowable on transmission line). For 0 dBm, JU1 and JU2 on the TRN6822A Auto Level Board are in; JU1 and JU2 are out for + 11 dBm systems. Also insure that all but one of the remote control units are connected in a line bridging mode.

Step 2. Insure that the remote control units are properly connected and the radio is operating correctly.

Step 3. Apply a 1000 uV on-frequency signal with modulation of 1 kHz at ± 3 kHz deviation at the antenna input.

Step 4. Slide PL MON ← switch on dc remote board in direction of arrow.

Step 5. Connect an ac voltmeter across the LN+ and LN- terminals on the radio.

Step 6. Adjust the line level control labeled LINE on the dc remote board for 0 dBm as indicated on the meter.

Step 7. Disconnect the rf signal generator and connect a suitable dummy load to the antenna connector.

Step 8. Connect a 1 kHz audio oscillator across the LN+ and LN- terminals and adjust for 0 dBm.

Step 9. Actuate the PTT switch on the service handset. This step keys the transmitter.

Step 10. Adjust the exciter level control labeled XMIT for a level 6 dB above the modulation sensitivity level (± 3 kHz deviation).

NOTE

Modulation sensitivity level + 6 dB is 6 dB above the level required for ± 3 kHz deviation. If a deviation monitor is not available, 320 mV at P100-6 will approximate the level required.

Step 11. Release handset PTT.

Step 12. Apply 160 mV, 1 kHz signal to P100-6 and adjust R32 for the same level as the receiver line level set in Step 6.

4.3 REMOTE CONTROL DC CURRENT LEVEL SETTING

FLEXAR Remote Control Base Stations use the detection of various levels and directions of remote control currents to activate the various remote control functions. The following dc line currents are employed:

FUNCTION	CURRENT AND DIRECTION LEVEL
PL MONITOR	-2.5 mA
KEY F1	+ 5.5 mA
KEY F2	+ 12.5 mA
F1 PAGE	-12.5 mA

Upon installation, each remote controller should be checked for proper current operation. Refer to the manual of the specific remote control unit being used.

On dc remote models the line disable jumper must be in the remote position to allow remote control.

800 MHZ FLEXAR BASE STATION

POWER AMPLIFIER AND RF DECK SERVICING PROCEDURES

1. INTRODUCTION

Due to the constraints imposed by the 800 MHz frequency range, special design techniques have been used in the RF Deck and Power Amplifier assemblies. As a result, unconventional procedures are required to properly service these assemblies. Detailed instructions on these unique servicing procedures are provided in the following paragraphs.

For main board servicing information (circuits not part of the RF Deck or Power Amplifier asemblies), refer to the schematic diagrams, circuit board details, and alignment procedures in this manual. Theory of operation is shown on the schematic diagreams.

2. GENERAL MICROSTRIP REPAIR PROCEDURES

2.1 MICROSTRIP CIRCUITS

The following table indicates those circuits on which microstrips are used.

ASSEMBLY	CIRCUITS USING MICROSTRIP
RF Deck	RF Amplifier Mixer Injection Doubler
Power Amplifier	Driver Power Doubler Final Amplifier Harmonic Filter/Antenna Switch

When faults are suspected in these circuits, they should first be inspected for visible defects such as broken leads, cracked microstrips, and broken or disconnected components.

NOTE

Cracked microstrips can often be found by sliding the tip of a modeling knife blade or some other sharp object along the surface of the ceramic substrate. Usually, a noticeable "bump" will be felt as the sharp object passes over the crack in the microstrip.

Carefully inspect all chip capacitors for evidence of leaching. Figure 1 shows several examples of leached capacitors. All visible defects should be corrected before any further troubleshooting steps are taken. If it is necessary to replace parts, follow the soldering instructions given in paragraph 2.2.

6	Tweezers	ST-492
Not shown	Modeling knife	ST-1172
	Five extra modeling knife blades	ST-1173

2.2 SOLDERING TECHNIQUES

2.2.1 When soldering microstrip circuits, always use silver solder with an alloy content of 1.4% silver, 36.1% lead, and 62.5% tin. Solder which satisfies this requirement may be obtained from Motorola; order part number 10-10041A61. Figure 2 shows recommended tools for microstrip repairs.

2.2.2 To remove and replace chip capacitors, perform the following operations:

Step 1. Remove the chip capacitor, using two soldering irons as shown in Figure 3.

Step 2. Dispose of the chip capacitor after it is removed. ***Chip capacitors must not be reused.***

Step 3. Install a new chip capacitor, using a low- wattage soldering iron (50 watts or less) with a chisel tip. See Figure 4.

CAUTION

Excessive heat applied during capacitor installation can cause leaching of the metallic contact area.

A reflow type technique *must* be used and the soldering iron tip *must not* be allowed to touch the chip capacitor end termination. After each solder operation, check for capacitor end metalization leaching. Figure 1 shows several examples of leached capacitors. If solder does not adhere to the complete end termination, assume that the termination is leached. Remember that leaching is probably the result of allowing the soldering iron to contact the capacitor end termination.

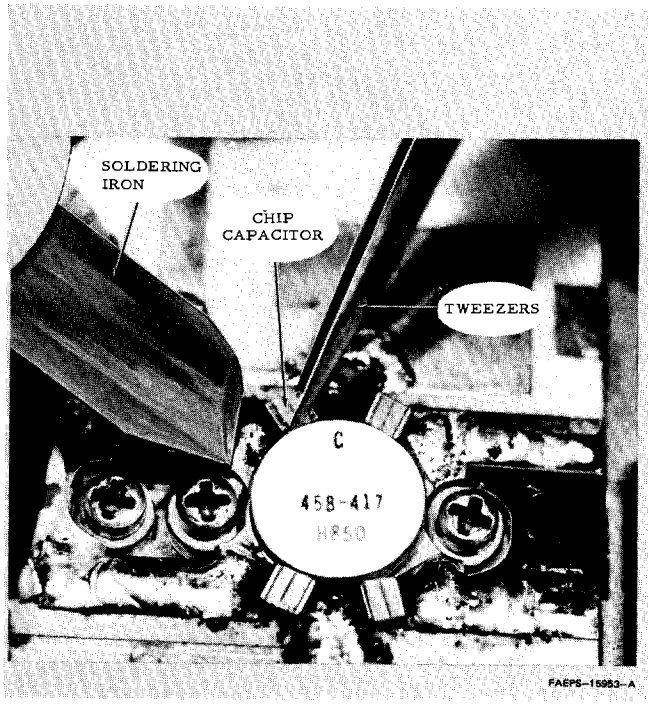

Figure 3. Chip Capacitor Removal Using Two Soldering Irons

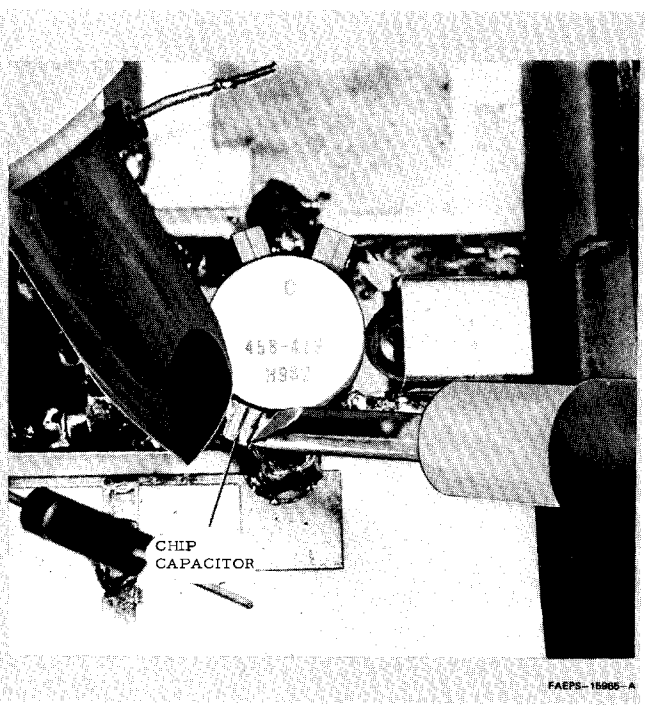

Figure 4. Chip Capacitor Installation Using a 50-Watt Soldering Iron With Chisel Tip

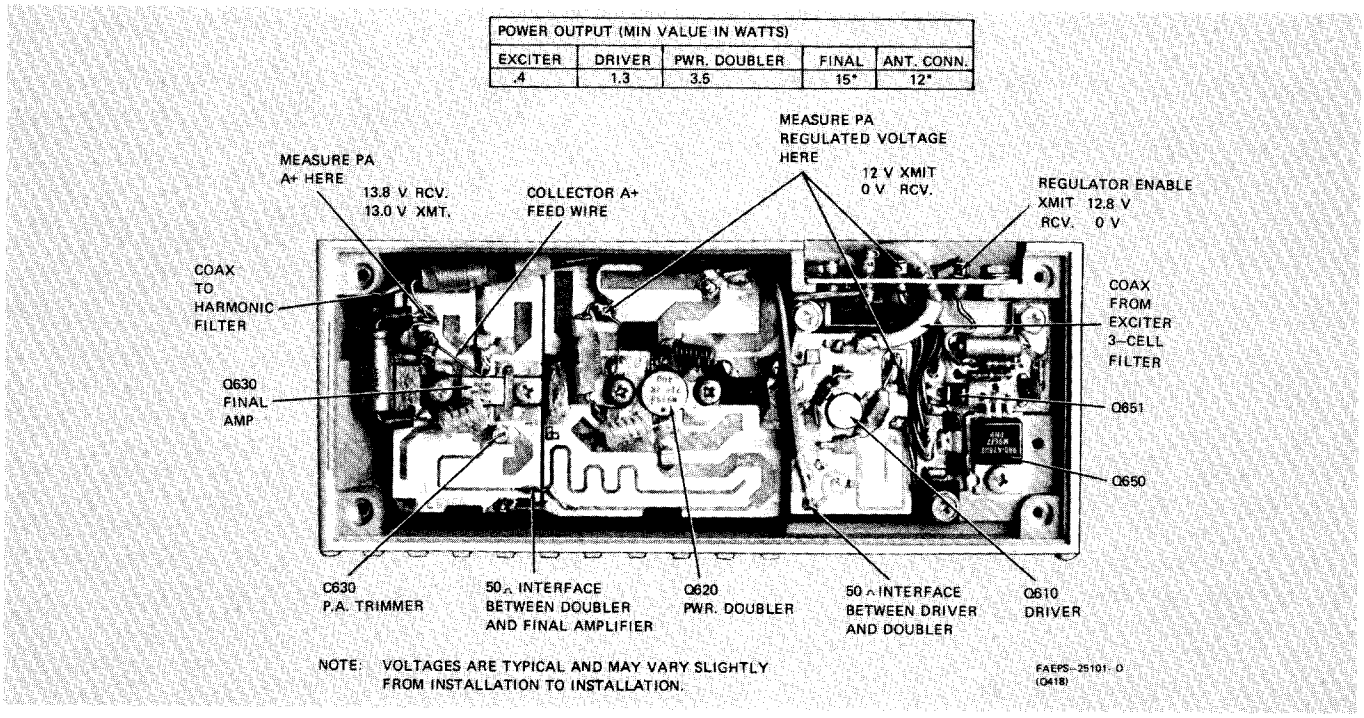

Figure 5. Power Amplifier, Troubleshooting Locations

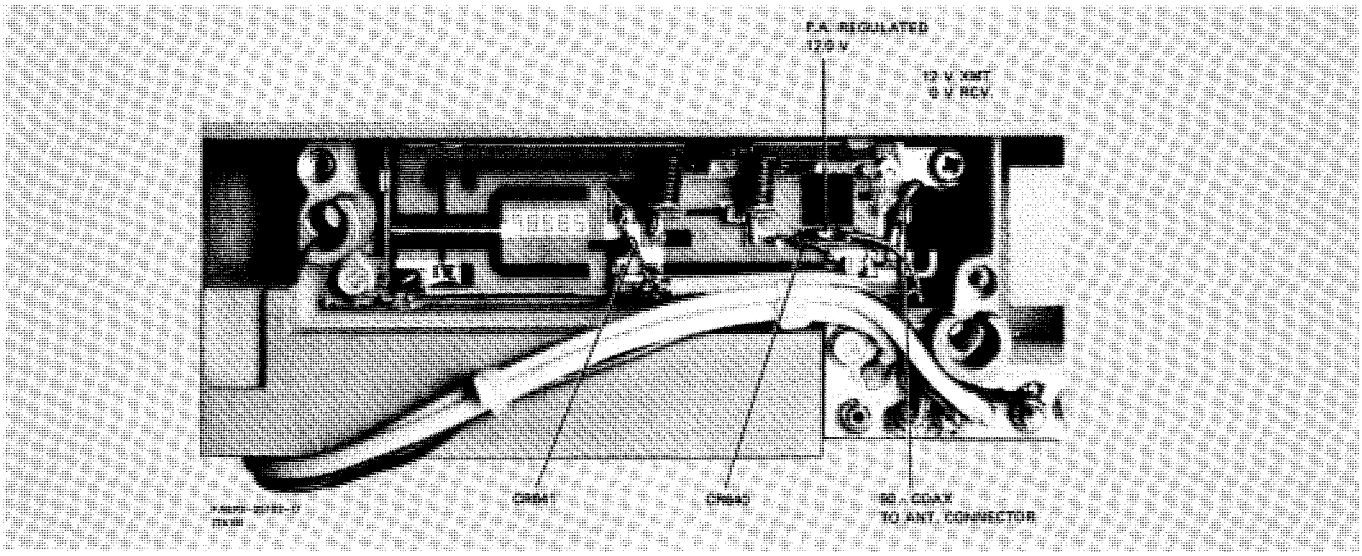

Figure 6. Harmonic Filter and Antenna Switch, Troubleshooting Locations

3. POWER AMPLIFIER TROUBLESHOOTING PROCEDURES

3.1 VISUAL INSPECTION

As an initial step, perform a visual inspection of the Power Amplifier circuits as described in paragraph 2.1. Correct all visible defects before any further troubleshooting steps are taken.

3.2 VOLTAGE CHECKS

Check the PA A + and PA regulated voltage at the locations indicated in Figures 5 and 6. If regulated voltage is not present, check regulator enable operation at feedthru noted in Figure 5. Troubleshoot main PC board push-to-talk circuit if enable is not present.

3.3 DEFECTIVE STAGE ISOLATION

3.3.1 General

If the visual and voltage checks do not reveal the cause of improper power amplifier operation, functional tests are required to determine which circuit is operating improperly. These functional tests are detailed below.

3.3.2 Exciter Test Procedure

Disconnect the coax cable from the exciter 3-cell filter. Connect a short length of coax (less than 8") from the 3-cell filter to a UHF-rated wattmeter. The wattmeter must be terminated in a 50 ohm resistive load. Verify that the power output of the exciter is at least 0.4 watts. If it is less than 0.4 watts, locate the cause of insufficient exciter output, referring to the schematic diagrams, circuit board detail, and alignment procedures provided elsewhere in this manual. If the exciter power output is acceptable, proceed to the Driver test. Remember to reconnect the coax to the exciter 3-cell filter.

3.3.3 Driver Test Procedure

Make sure the coax between the exciter and the Driver is intact. Unsolder the center conductor of the coax at the 50 ohm interface between the Driver and Power Doubler, leaving the grounded braid in place. (See Figure 5). Connect a short length of coax from this interface to a UHF-rater wattmeter terminated in a 50 ohm resistive load. Verify that the Driver power output is at least 1.3 watts.

If the Driver power output is less than 1.3 watts, it will be necessary to replace or repair the Driver module. See Section 4, Power Amplifier Circuit Replacement. If the Driver power output is acceptable, proceed to the Power Doubler test. Remember to reconnect the interface cable between the Driver and the Power Doubler.

3.3.4 Power Doubler Test Procedure

Make sure the interface cable between the Driver and Power Doubler is intact. Remove the wire jumper at the 50 ohmiinterface between the Power Doubler and the Final Amplifier. Connect a short length of coax (less than 8") from the Power Doubler output to a wattmeter. Be sure the wattmeter is rated for 800 MHz and is terminated in a 50 ohm resistive load.

Verify that the Power Doubler output is at least 3.5 watts. If the output is less than 3.5 watts, it will be necessary to replace or repair the Power Doubler module. See Section 4, Power Amplifier Circuit Replacement. If the Power Doubler output is acceptable, proceed to the Final Amplifier test. Remember to reconnect the Power Doubler-Final Amplifier interface with 22 gauge solid copper wire.

3.3.5 Final Amplifier Test Procedure

Make sure that the wire interface between the Power Doubler and the Final Amplifier is intact. Disconnect the center conductor at the coax on the output of the Final Amplifier stage, leaving the grounded braid in place. Connect a short length of coax (8" or less) from the Final Amplifier stage output to a wattmeter. Be sure the wattmeter is rated for 800 MHz and terminated in a 50 ohm resistive load. The Final Amplifier stage output power should be at least 15 watts.

NOTE

The piston trimmer capacitor on the input of the Final Amplifier has been factory adjusted for proper PA performance. It should not need adjustment unless the Final Amplifier transistor is replaced.

If the Final Amplifier power output is less than 15 watts, it will be necessary to replace or repair the Final Amplifier module. See Section 4, Power Amplifier Circuit Replacement. If the Final Amplifier power output is acceptable, the problem has been isolated to the Harmonic Filter and Antenna Switch module. Leave the Final Amplifier stage terminated in the 50 ohm load and proceed to the Harmonic Filter and Antenna Switch test.

3.3.6 Harmonic Filter and Antenna Switch Test Procedure

To test this module, perform the following steps:

Step 1. First, visually inspect the substrate and components for defects. Carefully check for cracks and leaching of chip capacitors.

Step 2. Check the voltage drop across each of the switching diodes, CR640 and CR641. Each should measure 0.7 $\pm$0.2 volts in the transmit mode. If either diode measures incorrectly, replace it before proceeding further.

Step 3. Test for dc continuity between the center conductor of the antenna connector and the center conductor of the coax feeding the connector at the 50 ohm point (see Figure 6). If this connector assembly tests faulty, disconnect the coax from the substrate and remove the connector from the heatsink assembly. Figure 11 shows the Antenna Connector Assembly.

4. POWER AMPLIFIER CIRCUIT REPLACEMENT

4.1 GENERAL

It is ***strongly recommended*** that the entire faulty PA stage be removed if the transistor is defective. Part placement and substrate positioning is extremely critical. Transistor replacement should *not* be attempted without the proper tools or by inexperienced personnel.

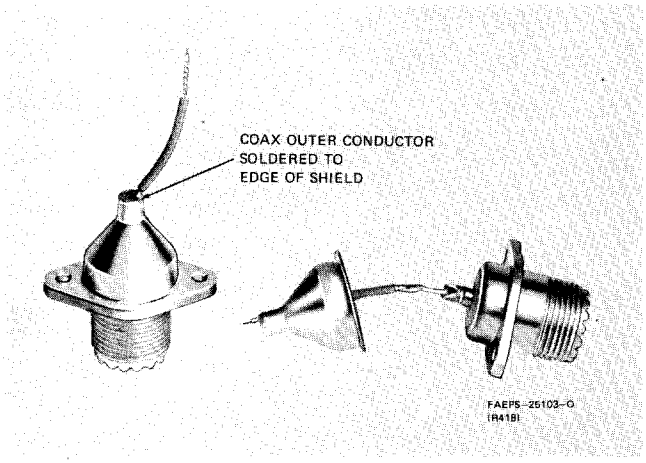

Figure 7. Antenna Connector Assembly

4.2 MICROSTRIP MODULE REMOVAL

To remove the Driver, Power Doubler, Final Amplifier or Harmonic Filter/Antenna Switch microstrips use the following procedure.

Step 1. Unsolder supply voltage choke or wire from its attachment at the microstrip.

Step 2. Disconnect the coaxial input and output lines from the microstrip.

Step 3. Disconnect all foil bridges between groukd pads of the faulty module and adjacent microstrips.

Step 4. Remove the two screws attaching the transistor to the PA heatsink. Remove the microstrip and its carrier assembly. In the case of the driver circuit, also remove the two mounting screws. Then lift out the microstrip, carrier and heatsink assembly.

4.3 MICROSTRIP MODULE REPLACEMENT

To replace the driver, power doubler, final amplifier or harmonic filter/antenna switch microstrips use the following procedure.

Step 1. Apply Wakefield Thermal Compound (Motorola Part No. 11-83166A01) to the mounting surface of the transistor (bottom side).

CAUTION

Thick coatings of thermal compound or foreign material on the transistor mounting surface will cause poor thermal contact and may result in early transistor failure.

Step 2. Place the microstrip assembly on the heatsink, and start but do not tighten the transistor mounting screws. Align the microstrip with adjacent microstrips and tighten mounting screws.

Step 3. Reconnect supply voltage leads, coax inputs and outputs, and foil ground straps.

5. POWER AMPLIFIER TRANSISTOR REPLACEMENT

NOTE

It is ***strongly recommended*** that the entire faulty PA stage be removed if the transistor is defective.

5.1 DRIVER TRANSISTOR REPLACEMENT

To replace the Driver transistor, perform the following steps:

Step 1. With the microstrip still in place, in the casting, remove all components that rest on the four transistor leads. Using a modeling knife and 50 watt soldering iron, pry up each lead. Make sure solder is completely melted before attempting to lift the lead.

Step 2. Now remove the mounting screws and lift out the driver microstrip. See Section 4, Power Amplifier Circuit Replacement, for details on removal.

Step 3. Clean the microstrip surface with alcohol or other solvent which leaves no residue.

Step 4. Lightly pre-tin the underside of the replacement transistor but do not leave excess solder.

Step 5. Install transistor on its small heatsink taking care to position the transistor leads and heatsink properly before tightening the transistor stud nut.

Step 6. Install the assembly into the PA heatsink and tighten the two mounting screws.

Step 7. Solder the transistor leads, components and interconnections at this time.

5.2 POWER DOUBLER AND FINAL AMPLIFIER TRANSISTOR REPLACEMENT

NOTE

If the Power Doubler or Final Amplifier transistors are replaced, the power amplifier must be retuned. Refer to paragraph 6.

The Power Doubler and Final Amplifier are very similar in construction. Both require ***extremely precise*** component placement and substrate spacing if the transistor is to be successfully replaced. To replace the transistor, perform the following steps.

Step 1. Lift all components that mount on the transistor leads.

Step 2. Unsolder each transistor lead, using a modeling knife to pry the lead up from the substrate. Apply enough heat to insure complete melting of the solder.

Step 3. Remove excess solder from transistor pads and clean with alcohol or other non-residue solvent.

Step 4. ***Lightly*** tin the bottom of each transistor lead and apply a thin layer of Wakefield compound to the mounting surface.

Step 5. Observing proper lead location, position the transistor such that each lead rests on its proper pad. Make sure that leads do not short to adjacent pads.

Step 6. Replace mounting screws and tighten securely, maintaining proper transistor alignment. Solder all leads back in exactly the same location, as close to the transistor as possible. See Figure 8 for critical part placement.

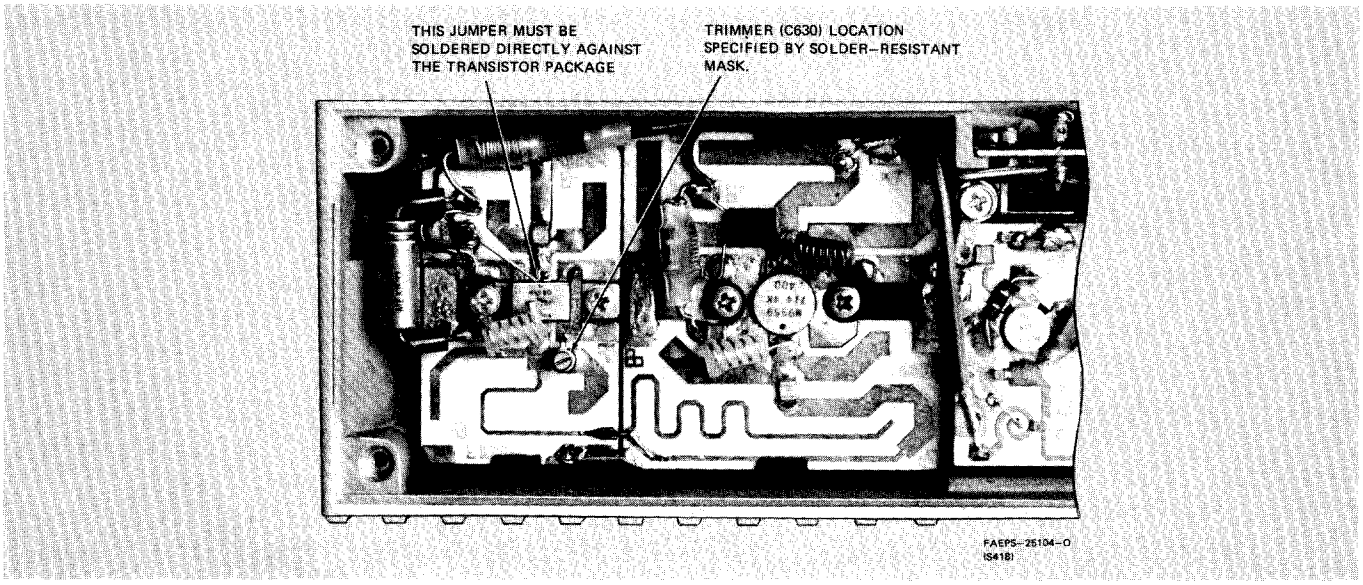

Figure 8. Critical Parts Location

6. FINAL AMPLIFIER ALIGNMENT PROCEDURE

The following procedure should be performed only if the Power Doubler or Final Amplifier transistors are replaced. C630 is factory set and must ***not*** be retuned unless one of these stages is replaced. If total retuning is necessary, perform the following steps.

Step 1A. If the transmitter frequency is above 807 MHz, remove the channel element and replace it with one at or below 807 MHz.

NOTE

It is necessary to tune the radio up initially below 807 MHz. If a channel element of 807 MHz is not available, the procedure in Step 1B may be used.

Step 1B. Remove the channel element and connect a 44.8 MHz signal to pin 3 of the transmit channel element socket through a 0.1 uF disc capacitor. (To identify pin 3 note that pin 6 of the socket is grounded by solder side plating.) Using an RF voltmeter, set the injection level to produce 0.25 volts from pin 3 to ground.

Step 2. Perform Steps 1-8 of the Transmitter Alignment Procedure PEPS-27483 at 806.4 MHz (44.8 MHz x 18) or at the transmitter frequency if it is below 807 MHz.

Step 3. Preset the final amplifier trimmer capacitor C630 fully clockwise. Then tune counterclockwise for 12.5 watts output.

Step 4. Install the operating channel element and tune the radio per the standard tuning procedure. If ***and only if*** output power is below 12 watts, tune C630 to 12 $\pm$ 0.5 watts output.

CAUTION

Failure to ***properly*** tune C630 could result in spurious emissions exceeding FCC regulations.

EXPLANATION OF SECTION 89.652

The following is an excerpt from section 89.652 of the FCC Rules and Regulations:

The strength of the signal of a control station, controlling a single mobile relay station, may not exceed, by more than 6 dB, at the antenna terminal of the mobile relay receiver, the signal strength produced thereby a unit of the associated mobile station.

The measurement of the signal strength of the mobile unit must be made when such unit is transmitting from the control station location or, if that is not practical from a location which is not more than one-fourth mile from the control station site.

The following charts can be used to assist the user in complying with 6 dB rule. The In Liine Attenuation Chart depicts the mobile station's (horizontal axis) and control station's (vertical axis). Effective Radiiated Power in either watts or dBm. The series of slanted lines crossing the chart displays the attenuation that must be added to the antenna network of the control station to comply with the 6 dB rule.

For example, suppose the mobile station has 30 watts (44.7 dBm) ERP and the control station has 150 watts (44.7 dBm) ERP and the control station has 150 watts (51.76 dBm) ERP. Using the chart, the control station will need 1 dB of in-line attenuation to meet the FCC requirements.

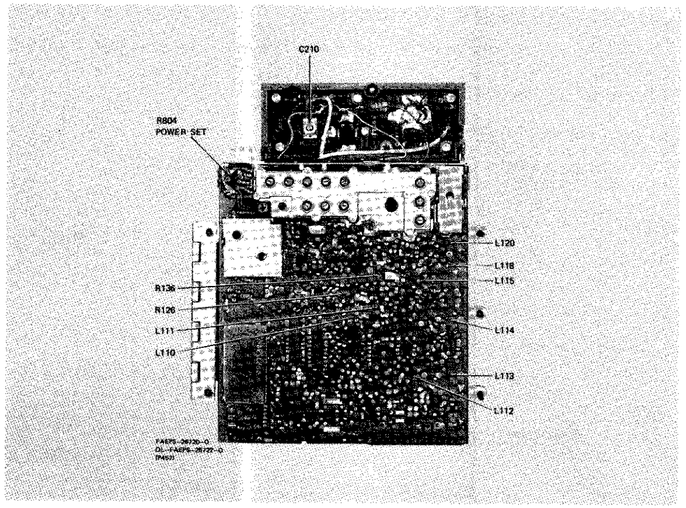
VHF TRANSMITTER ALIGNMENT PROCEDURE



TRANSMITTER METERING

Transmitter Meter Readings, Using TEK-5 Metering Panel or S1056B Portable Test Set

METER	MEASUREMENT	READING,(uA)	REMARKS
3	Buffer Amplifier Input	8 (MIN)	
5	Exciter Amplifier Collector Current	25(TYP.) 40 (MAX)	
7	PA Current	11 (TYP.) 17 (MAX)	Multiply M7 x 0.336 to obtain PA Final Current in Amps

Transmitter Meter Readings With 20,000 Ohm/Volt Voltmeter

METERING FUNCTION	VOLTMETER LEAD CONNECTIONS +	VOLTMETER LEAD CONNECTIONS —	VOLTMETER SCALE	TYPICAL READING
M3 Buffer Ampl. Input	J601-14	Chassis Ground	50 uA, DC	8 uA min.
M5 Exciter Output Amplifier Collector Current	J601-7	J601-11	100 mA, DC	17 mA. Typ. 100 mA. Max.
M7 PA Current	J601-7	J601-15	500 mA, DC	270 mA Typ. 385 mA Max.

TRANSMITTER

PREALIGNMENT NOTES

1. In some cases, peak readings may occur at two points in the tuning range of a coil. Always choose point where slug is nearest top of coil form (away from circuit board).

2. Unnecessary tuning adjustments should be avoided. Usually, only a "touch-up" transmitter alignment is needed. Complete transmitter alignment is needed in the following cases:

   a. After changing transmitter operating frequency.
   b. After replacing a component in a frequency-sensitive network.

3. Before beginning a complete alignment, preset tuning adjustments as follows:

   a. Set L120 7 turns from top of form.
   b. Set C210 1/4 turn counterclockwise from tight.
   c. Set L110 (and L111 in 2-frequency models) 7 turns from circuit board.

CAUTION

Low or no meter 3 reading will be obtained if L110 and L111 are not properly preset.

   d. Set L112, L113, L114, L115, and L118 according to the following chart:

   e. Set power set control R804 fully counterclockwise (viewed from solder side of board) for maximum transmitter power output.

4. Key transmitter for each step in alignment procedure and de-key after alignment step is completed. Avoid keying an unaligned transmitter for prolonged periods.

5. Two-frequency radios should be aligned on lowest operating frequency.

6. Transmitter frequency calculations:

   $f_c = 9\, f_{osc.}$, where f_c = carrier frequency, and f_{osc} = crystal oscillator frequency.

SET-UP

1. If a TEK-5 Metering Panel or a S1056B Portable Test Set is available, connect the metering panel or test set to J601 using the appropriate metering adapter cable. The metering adapter cables and directions for their use are shown on PEPS-20882. Metering may be accomplished with a 20,000 ohm-per-volt voltmeter if a test set or metering panel is not available. Refer to the metering tables on this page.

2. Connect an rf wattmeter, terminated in a resonant antenna or 50-ohm resistive dummy load, to radio set antenna connector J602.

3. Connect a dc power supply to the power leads of the test cable. Set the power supply output to 13.8 volts.

TRANSMITTER ALIGNMENT

1		L110, 111, 112, 113, 114, 115, 118, 120, C210 (25 W)		Preset controls per chart, set power set pot R804 to maximum CCW position as viewed from bottom of main board.
2	3	L112, 113	Peak	Tune the oscillator output coils L112 and L113 in that order for peak reading on M3.
3	3 or 5	L114		If the buffer output coil, L114, has been preset, and if position 5 does not read, tune L114 for dip in position 3. If only a minimum adjustment is being made and there is a position 5 reading, tune L114 for a peak reading in position 5.
4	5	L115, 118	Peak	Tune the tripler coils L115 and L118, in that order, for a peak reding in position 5.
5	Wattmeter or 5	L120	Peak	Tune coil L120 CCW from bottom of main board for peak power output on wattmeter.
6	Wattmeter	C210 (25 Watt)	Peak	Tune C210 for peak power output.
(Step 7 for multi-freq. only)				
*7	Wattmeter	L112, 118, 120	Peak	Tune L112, L118, & L120 in that order for peak power output.
*8	Wattmeter	L112		Detune L112 for a wattmeter reading of 15 watts.
*9	Wattmeter	L120, 118	Peak	Tune L120 & L118 for peak power on wattmeter. If wattmeter reading increases more than 5 watts repeat Step 8.
*10	3	L112	Peak	Retune L112 for maximum Meter 3 reading.
10A.	Final Output	L114	M3, M5	Dip M3 while maintaining M5 as high as possible.
11	Wattmeter	C210	Peak	Retune C210 for peak power out on wattmeter.
11A.	Power Output	L113	M3	Peak. Retune L113 for a peak on M3.
12	Wattmeter	R804 Power Set		Adjust R804 to reduce power output to 28 watts. For multi-frequency operation, set R804 so that the channel with the lowest power output is 28 watts.
13	Wattmeter	R804 Power Set		Close PA and tighten heatsink to chassis. Repeat Step 12. M7 should be below 17 uA.

NOTE

Two-frequency radios should be tuned on lower frequency except where indicated with an asterisk.

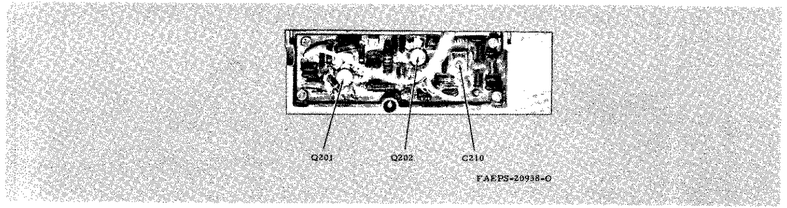
TRANSMITTER ALIGNMENT PROCEDURE (cont'd.)
IDC ADJUSTMENT

NOTE

If the maximum power output obtainable is less than 28 watts, go back to Step 2 of the exciter alignment procedure and repeat the alignment a second time. If the maximum obtainable power output is still below 28 watts, proceed as follows:

IF MAXIMUM IS BETWEEN 26 AND 28 WATTS:
Set R804 so that power output just begins to drop (less than 1/2 watt).

IF MAXIMUM IS LESS THAN 25 WATTS:
The transmitter may be malfunctioning. Refer to the transmitter schematic diagram for troubleshooting information.



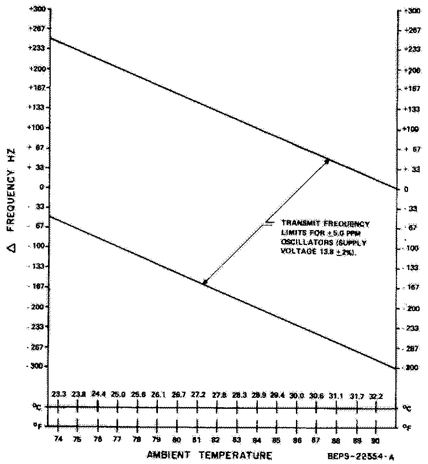
OSCILLATOR FREQUENCY ADJUSTMENT

Oscillators should be set on frequency AFTER transmitter has been aligned and BEFORE modulation dieviation is set.

NOTE

The transmit frequency of this radio should only be adjusted when the ambient temperature is 82°F (28°C). Because of temperature and voltage variations between factory and field locations, the frequency measured may not correspond to the assigned frequency. If the measured frequency is between the limits shown on the graph given below make no attempt to correct the frequency.

ACCEPTABLE LIMITS FOR FIELD FREQUENCY MEASUREMENTS



If the measured frequency does not fall within the limits shown on this graph, it is recommended that the radio be returned to a room temperature environment (approximately 82°F, 28°C) and the frequency reset using the procedure described below.

SET-UP

1. Set up the frequency meter or counter controls as required.
2. In tone-coded *"Private-Line" (PL)* radios, remove the "Vibrasponder" resonant reed from its socket on the PL board.
   In *"Digital Private-Line" (DPL)* radios, set encoder amplitude to zero by adjusting R342 (fully CCW from plating side of board).

Frequency Adjustment Procedure

STEP	PROCEDURE
1	Select F1
2	Key transmitter with no modulation
3	Adjust L110 for F1 frequency ± 100 Hz
	Two-Frequency Models Only
4	Select F2
5	Adjust L111 for F2 frequency ± 100 Hz

Oscillator frequency adjustment must be made BEFORE setting the IDC controls

SET-UP

1. Set the deviation meter operating controls as needed.
2. In tone coded *"Private-Line"* radios, remove the "Vibrasponder" resonant reed from its socket on the PL board.

   In *"Digital Private-Line"* radios, set encoder amplitude to zero by adjusting R342 (fully CCW from plating side of board.)
3. Disconnect mic input lead (red) from main circuit board.
4. Connect the output of an audio signal generator to J601 as follows:

   High side through a 1 uF capacitor (+ end toward the radio) to J601-5.
   Low side to J601-6 or radio chassis.

NOTE

The transmitter must be keyed by pressing the KEY button on the test set or by shorting J601-8 to J601-6 or the radio chassis. DO NOT USE THE MICROPHONE PTT SWITCH TO KEY THE TRANSMITTER DURING IDC ADJUSTMENT.

5. Connect an ac VTVM across the audio signal generator output.

IDC Adjustment Procedure

STEP	PROCEDURE
1	Set audio signal generator output frequency to 1000 Hz and output level to 0.8 V.
2	Select F1 and key transmitter. Adjust F1 "IDC" control R126 for ± 5 kHz deviation meter reading.
3	On 2-freq. models, select F2 and key transmitter. Adjust F2 "IDC" control R136 for ± 5 kHz deviation meter reading.
4	Reduce audio signal generator output level until deviation meter reads ± 3.0 kHz. Audio oscillator output level should be 160 mV ± 3 dB.
	Tone Coded "Private-Line" Models Only
5	Insert resonant reed into socket on PL board and disconnect audio oscillator from J601.
6	Key transmitter and adjust Tone Level control R433 for PL tone deviation reading of ± 800 Hz.
7	Reconnect audio signal generator to J601-5 and -6 and repeat Steps 1 through 3. Be sure overall deviation does not exceed ± 5 kHz, including PL tone.
	or
	"Digital Private-Line" Models Only (see note)
5	Disconnect the audio signal generator from J601.
6	Key the transmitter and adjust Code Level set control R342 for a DPL code deviation reading of 900 Hz.
7	Reconnect the audio signal generator to J601-5 and -6. Repeat Steps 5 and 6. Be sure overall deviation does not exceed ± 5 kHz, including DPL code. 1 through 3.

NOTE

DEVIATION MEASUREMENT

To obtain accurate measurement of transmitter deviation in radios equipped with "Digital Private- Line" binary-coded squelch, the frequency response of the deviation measuring equipment must be 1 Hz. If a deviation meter with this low frequency response characteristic is not available, the transmitter deviation can be checked by making the transmitter send continuous Turn-Off code during the measurement. Since the Turn- Off code waveform is sinusoidal, standard test equipment will then provide an accurate deviation measurement. To make the transmitter send continuous Turn-Off code, short together the base and emitter plating of PTT Inverter Q309 and key the transmitter.

RECEIVER

PREALIGNMENT NOTES

1. On "Digital Private-Line" and "Private-Line" radio sets, disable the DPL or PL decoder by depressing the front panel MONITOR pushbutton.

2. In some cases, peak meter readings may occur at two points in the tuning range of a coil. Always choose point where the slug is nearest the top of the coil form (away from the circuit board).

3. Unnecessary tuning adjustments should be avoided. Usually, the receiver will require only a "touch-up" alignment. Complete receiver alignment is necessary in the following cases:

   a. After changing the receiver operating frequency.
   b. After replacing a component in a frequency-sensitive network.

4. Before beginning a complete receiver alignment, preset tuning adjustments as follows:

   a. If a PREAMP is used, set L201, 202, 203 fully CCW out of rf deck.
   b. Set L205, 206, 207, 208, 209, 210, 211, 212 fully CCW out of rf deck.
   c. Set L12, 13, 15 flush with bottom of coil form by turning CCW.
   d. Set L213 seven turns clockwise from top of coil.
   e. Set L18, 20, 21, 23 flush with bottom of coil form by turning CCW.

5. Receiver frequency calculations:

   $f_{osc} = \frac{f_c - 10.7\ MHz}{3}$ and $f_{inj} = 3\ f_{osc} = f_c - 10.7\ MHz$;

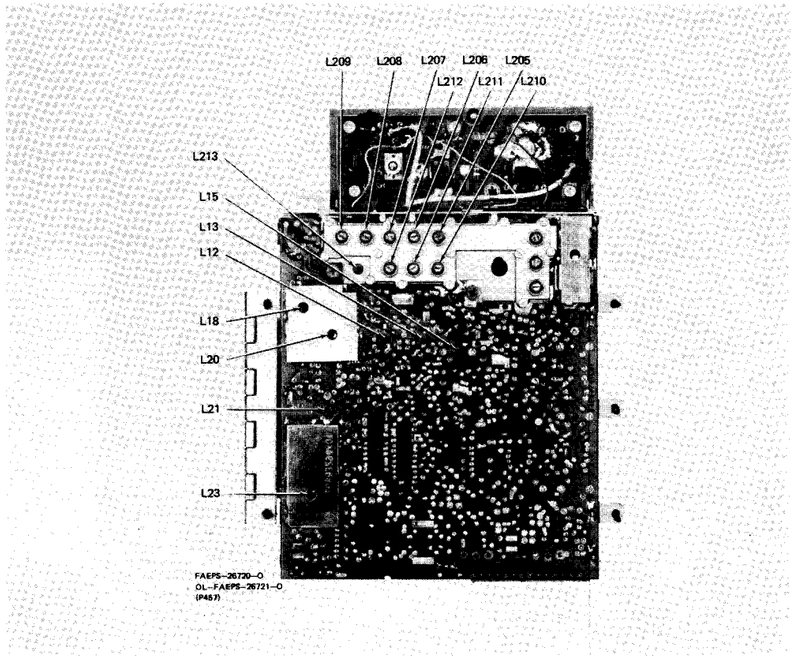
   Where f_c = carrier frequency, f_{osc} = oscillator crystal frequency, and f_{inj} = mixer injection freq.

6. Two-frequency radios should be tuned on the higher operating frequency.

TEST EQUIPMENT SET-UP

1. If a TEK-5 Metering Panel or a S1056-59 Portable Test Set is available, connect the metering panel or test set to J601 using the appropriate metering adapter cable. The metering adapter cables and directions for their use are shown in Figure 6. Metering may be accomplished with a 20,000 ohm-per-volt voltmeter if a test set or metering panel is not available. Refer to the voltmeter metering table on this page. Voltage readings with a VOM will not be accurate if metering panel or test set is connected simultaneously.

2. Connect a dc power supply to the power leads of the test cable. Set the power supply output to 13.8 volts.



RECEIVER METERING

Typical Receiver Meter Readings With TEK-5 Metering Panel or S1056-59 Portable Test Set

METER	MEASUREMENT	READING, uA
1	IF Amplifier Signal Level	8-14 (No Signal) 50 (40 uV Input)
2	Quadrature Detector Output	22 ± 1
3	Injection Oscillator Output	18-28 uA

Receiver Meter Readings With 20,000 Ohm/Volt Voltmeter

METERING POINT	VOLTMETER LEAD CONNECTIONS +	—	VOLTMETER SCALE	TYPICAL READINGS
M1 IF Ampl. Signal Level	J601-10	Chassis Ground	2.5 V DC	.25-.5 V (No Signal) 1.75 V (40 uV Input)
M2 Quadrature Detector Output	J601-13	Chassis Ground	10 V DC	5.1 V ± .2 V (5.5 V Using DC Multimeter)
M3 Injection Osc. Output	J601-14	Chassis Ground	50 uA DC	18-28 uA

RECEIVER ALIGNMENT PROCEDURE

NOTE
Transmitter alignment must be performed before receiver alignment.

	Step	Input Signal	Signal Input Point	Adjust	Monitoring Point	Desired Reading
1	Quadrature Detector	10.7 MHz @ 1 mV	Near Q12; allow signal to "spray" into circuit (Note 1)	L23	Meter 2	22 ± 1 uA
						or
					DC Multimeter at J601-13	5.5 V DC
2	Injection Oscillator			Freq Select Switch in "F1", adjust L13	Meter 3	Peak
				Freq Select Switch in "F2", adjust L12	Meter 3	Peak
				Freq Select Switch to lowest freq position, then:		
				L15	Meter 3	Max
				L210		Dip
				L211		Peak
				L212		Dip
3	Preamp Input	Receive freq. @ 10 mV (Note 2)	Antenna Connector	L201, 202, 203, 204	Meter 1	Peak. (Adjust signal generator input level to keep M1 in the 25 uA-35 uA range)
4	Preselector	Adjust un-modulated signal generator to receive freq. (max. on M1; ± 18 kHz of formula frequency)	Antenna Connector	Set Freq. Select Switch to highest freq. position, then adjust L209, 208, 207, 206, 205	Meter 1	Peak. (Adjust signal generator input level to keep M1 in the 25 uA-35 uA range). Repeat, and then peak M1 by adjusting L213
5	IF Tuning	Receive Freq. (counted)	Antenna Connector	L18, 20, 21	Meter 1	Peak M1 with L18, 20, 21. (Adjust signal generator in put level to keep M1 in the 35 uA-40 uA range). If two peaks are present, choose the one nearest the top of the coil form. Repeak, and then detune L211/2 turn ccw.
6	Injection Touch-Up	Receive Freq. (no modulation). Adjust level for 30 uA reading on M1.	Antenna Connector	Set Freq. Select Switch to lowest freq. position, then adjust L15	Meter 1	Detune ccw for a minimum M1
				L212, 211, 210; then repeat.	Meter 1	Peak
				L15	Meter 3	Peak
7	Fine Freq. Adj.	Receive freq. (counted)	Antenna Connector	L13 for freq. #1 L12 for freq. #2 (2 freq radios only)	Radio Speaker	Audio zero beat. Repeat after a 20 minute warmup
		10.7 MHz Osc.	"Spray" into base of Q12 (Note 1)			

NOTES:
1. With a wire connected to a 10.7 MHz signal source output, "spray" the signal near Q12 (that is, place the wire close to Q12) but do not allow the wire to make physical contact with any part of the i-f amplifier.
2. To set signal generator on frequency, either use a counter on the generator output, or use the zero beat method. Do not use meter 2 to set frequency.

20 DB QUIETING SENSITIVITY MEASUREMENT

1. Connect an ac voltmeter across the speaker.
2. On PL model radio sets, disable PL by depressing the MONITOR button on the radio set front panel.
3. Turn the SQUELCH control fully counterclockwise.
4. Turn on the radio set and adjust the VOLUME control until a reading of 2 volts is obtained on the ac voltmeter.
5. Connect an rf signal generator to the radio set antenna connector. Set the signal generator to the carrier frequency, and set the generator output level control to minimum.
6. Slowly increase the output level of the rf signal generator until the ac voltmeter reads 0.2 volts.
7. Note the signal generator output signal level. This signal level is the 20 dB quieting sensitivity of the receiver.

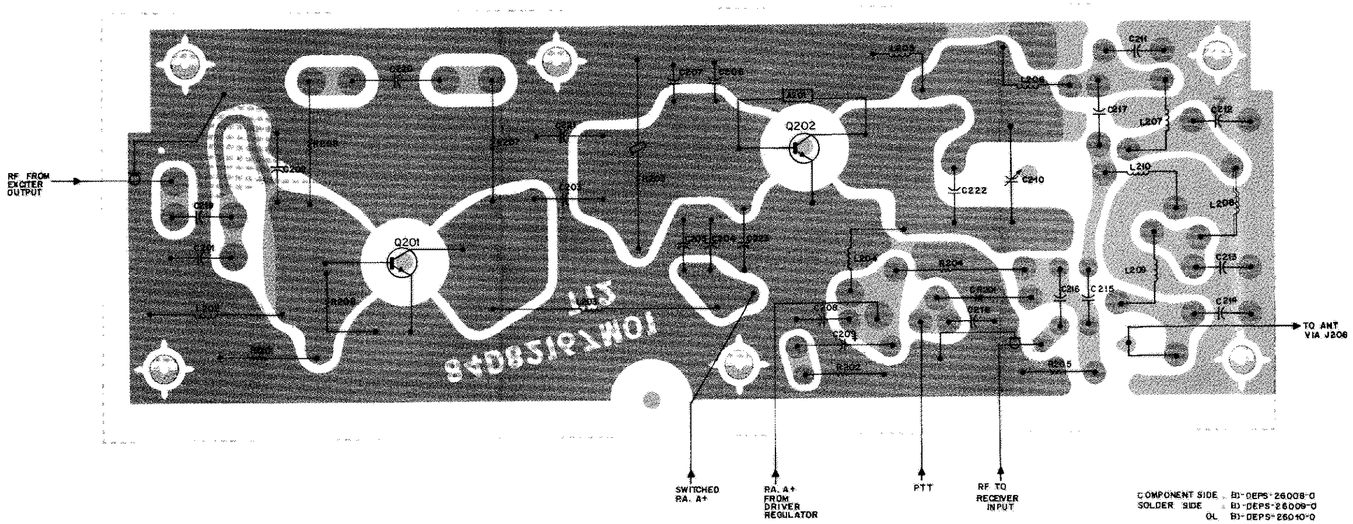
25-WATT RF POWER AMPLIFIER HARMONIC FILTER, AND ANTENNA SWITCH

MODELS TLD2301A (132-150 MHz)
TLD2302A (150-162 MHz)
TLD2303A (162-174 MHz)



SHOWN FROM COMPONENT SIDE

FUNCTION

Provides a filtered 25-watt frequency-modulated rf signal to the antenna; the antenna switches the antenna between the transmitter and the receiver.

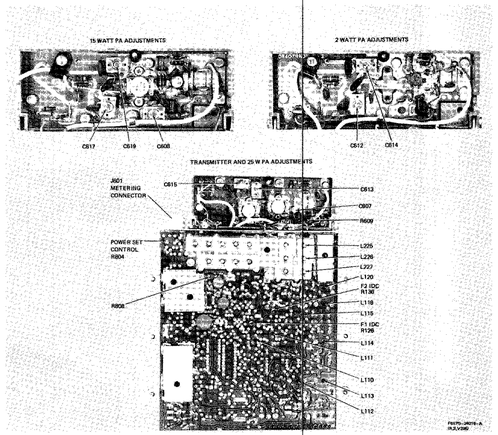
NOTE:
For optimum performance, replacement diodes and transistors must be ordered by Motorola part number.

UHF TRANSMITTER ALIGNMENT PROCEDURE



PREALIGNMENT NOTES

1. In some cases, peak readings may occur at two points in the tuning range of a coil. Always choose point where slug is nearest top of coil form (away from circuit board).

2. Unnecessary tuning adjustments should be avoided. Usually, only a "touch-up" transmitter alignment is needed. Complete transmitter alignment is needed in the following cases:

   a. After changing transmitter operating frequency.
   b. After replacing a component in a frequency-sensitive network.

3. Before beginning a complete alignment, preset tuning adjustments as follows:

   a. Check supply voltage (13.8 V ±0.1 V).
   b. Set L120 seven turns from top of form (10 turns for 406-420 MHz models).
   c. Set L110 (and L111 in 2-frequency models) seven turns from circuit board.

NOTE

Low or no meter 3 reading will be obtained if L110 and/or L111 are not properly present.

   d. Starting with slugs of L225, L226, and L227 flush with tension nuts, adjust to six turns above tension nuts.
   e. Set R804 and R808 fully CCW (as viewed from the bottom of the radio).
   f. Set L112, L113, L114, L115, and L118 according to the following chart:

   g. For 25/30 watt models, set C613 one turn CCW from fully CW and C615 three turns CCW from fully CW.
      For 15 watt models, set C608, C617, and C619 one-half turn CCW from fully CW.
      For 2 watt models, set C612 and C614 three turns CW from fully CW.

4. Key transmitter for each step in alignment procedure and de-key after alignment step is completed. Avoid keying an unaligned transmitter for prolonged periods.

5. Two-frequency radios should be aligned on lowest operating frequency.

6. Transmitter frequency calculations:

   where $f_c = 27f_{osc}$, where f_c = carrier frequency, and f_{osc} = crystal oscillator frequency.

7. Check that JU5 is in for 2 and 25/30 watt models and out for 15 watt models.

SET-UP

1. If a TEK-5 Metering Panel or a S1056B Portable Test Set is available, connect the metering panel or test set to J601 using the appropriate metering adapter cable. The metering adapter cables and directions for their use are shown in Figure 2. Metering may be accomplished with a 20,000 ohm-per-volt voltmeter if a test set or metering panel is not available. Refer to the metering tables on this page.

2 Connect an rf wattmeter, terminated in a resonant antenna or 50-ohm resistive dummy load, to radio set antenna connector J602.

TRANSMITTER ALIGNMENT

NOTE

Two-frequency radios should be tuned on lowest frequency.

STEP	ADJUST	METERING POINT	DESIRED READING
1. Oscillator output	L112, then L113	M3	Peak
2. Buffer Output	L114	M3	Dip if no M5 reading
		M5	Peak if M5 has a reading
3. First Tripler Output	L115 then L118	M5	Peak
4. Second Tripler Output	L120	Wattmeter	Peak if wattmeter has reading
		M5	Peak if no wattmeter reading
5. Predriver output	C607 (30/25 W only)	Wattmeter	Peak. If no wattmeter reading, go to step 6.
6. Second Tripler Output Filter	L225, 226, 227	Wattmeter	Peak. (If no wattmeter reading, turn C607 1/4 T clockwise and repeat Step 6, for 30/25 watt.)
7. Predrive and Final Output	C607, 613, 615 (30/25 W only)	Wattmeter	Peak
Repeat all adjustments made to this point (Steps 8-14 for 25/30 watt models only)			
8. Predriver Output	C607	Wattmeter	Adjust for 20 watts output (30/25 watt models)
9. Second Tripler Output	L225, 226, 227	Wattmeter	Peak each coil while keeping wattmeter reading between 20 and 25 watts with C607
10. Oscillator Output	L112	Wattmeter	Adjust for 15 watts output
	L113	Wattmeter	Adjust for 15 watts output if not obtainable by tuning L112 alone
11. Second Tripler Output	L120	Wattmeter	Peak. If wattmeter reading is greater than 20 watts, repeat Steps 10 and 11.
12. Repeat Step 9			
13. Oscillator	L112, then L113	M3	Peak
14. Predriver Output	C607	Wattmeter	Peak
On 30/25 watt models: For widespace operation (greater than 2 MHz frequency separation) go to Step 17; otherwise go to Step 23. On 15 watt models: Go to Step 15. On 2 watt models: Go to Step 16.			
15A. 15 Watt Power Amplifier	C608,C617,C619	Wattmeter	Peak
15B. Repeat Steps 1-4			
15C. Oscillator Output	L112	Wattmeter	Adjust for a 5 watt reading
15D. Oscillator Output	L120	Wattmeter	Peak
15E. Oscillator Output	L112	M3	Peak
Repeat Step 6. For widespaced operation (greater than 2 MHz separation) on 15 watt models, go to Step 17; otherwise go to Step 23.			
16A. 2 Watt Power Amplifier	C612,C614	Wattmeter	Peak (note: C614 is not adjustable in 470-494 MHz models)
16B. Repeat Steps 1 through 3 and Step 6			
16C. Buffer Output	L114	Wattmeter	Adjust for 2.0 watts reading
16D. Second Tripler Output Filter	L227,L226,L225	Wattmeter	Peak L227,L226,L225 (in this order) for maximum
16E. Second Tripler Output Filter	L120	Wattmeter	Peak
16F. Buffer Output	L114	M5	Peak
16G. Oscillator Output	L112,L113	M3	Adjust L112 and L113 (in this order) for maximum
For widespaced operation (greater than 2 MHz separation) on 2 watt models, go to Step 27; otherwise go to Step 28.			
17. Oscillator Output	L112	M3	Peak on higher frequency
18. First Tripler Output	L115	M5	Peak on higher frequency
19. Buffer Output	L114	M5	Peak on lower frequency
20. Predriver Output (30/25 Watt Models Only)	C607	Wattmeter	Adjust for 20 watts on higher frequency
21. Second Tripler	L225	Wattmeter	Peak on higher frequency
22. Predriver Output (30/25 Watt Models Only)	C607	Wattmeter	Peak
23. Power Set	R804	Wattmeter	Adjust for: 33 watts for 30 watt models. 28 watts for 25 watt models. 17 watts for 15 watt models. For widespaced radios, tune on lowest power frequency
24. Final Output (30/25 Watt Models Only)	C613,C615	Wattmeter	Peak. For widespaced radios peak on lower frequency. If the difference between power levels is greater than 3.0 watts, re-adjust C613 until difference is less than 3.0 watts. Repeat Steps 23 and 24 as required. Go to Step 26.
25. Final Output (15 Watt Models Only)	C617,C619	Wattmeter	Peak. For widespaced radios, peak on lower frequency. If the difference between power levels at two frequencies is greater than 3.0 watts, re-adjust C617 until difference is less than 3.0 watts.
26. Thermal Shut-back (30/25 Watt Models Only)	R609	Wattmeter	Adjust for 16 watts by jumpering base of Q604 to ground with a 6.2k resistor. Go to Step 29.
27A. First Tripler Output	L115	M5	Peak on higher frequency
27B. Buffer Output	L114	M5	Peak on higher frequency
27C. Second Tripler	L226	Wattmeter	Adjust for 0.5 watts on lower frequency
27D. Second Tripler	L225,L227	Wattmeter	Adjust L227 then L225 for peak on lower frequency.
27E. Second Tripler	L226	Wattmeter	Peak on higher frequency and adjust to balance power on both frequencies.
28. Power Set	R804	Wattmeter	Adjust for 2.2 watts. On two frequency radios adjust for 2.2 watts on frequency with lower power reading.
29.			Close power amplifier and secure with captive screws.
M7 should read 17 uA for each power level 2, 15 or 25/30 watts.			

NOTE

For units on which adjustment of R804 provides insufficient power cutback, R808 also should be used.

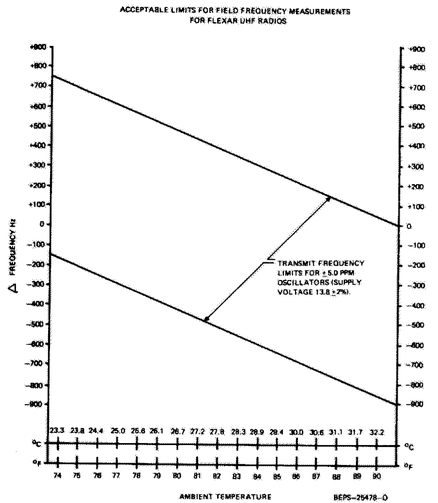
OSCILLATOR FREQUENCY ADJUSTMENT

Oscillator should be set on frequency AFTER transmitter has been aligned and BEFORE modulation deviation is set.

NOTE

The transmit frequency of this radio should only be adjusted when the ambient temperature is 82°F (28°C). Because of temperature and voltage variations between factory and field locations, the frequency measured may not correspond to the assigned frequency. If the measured frequency is between the limits shown on the graph given below make no attempt to correct the frequency.

If the measured frequency does not fall within the limits shown on this graph, it is recommended that the radio be returned to a room temperature environment (approximately 82°F, 28°C) and the frequency reset using the procedure described below.



SET-UP FOR RADIOS WITH 5 PPM STABILITY

1. Set up the frequency meter or counter controls as required.
2. *In tone-coded "Private-Line" (PL) radios,* remove the "Vibrasponder" resonant reed from its socket on the PL board.

   In "Digital Private-Line" (DPL) radios, set encoder amplitude to zero by adjusting R342 (fully CCW from plating side of board).

Frequency Adjustment Procedure

STEP	PROCEDURE
1	Select F1
2	Key transmitter with no modulation
3	Adjust L110 for F1 frequency ± 100 Hz
	Two-Frequency Models Only
4	Select F2
5	Adjust L111 for F2 frequency ± 100 Hz.

SET-UP FOR RADIOS WITH 2 PPM STABILITY

1. Set up the frequency meter or counter controls as required.
2. *In tone-coded "Private-Line" (PL) radios,* remove the 'Vibrasponder" resonant reed from its socket on the PL board.

   In "Digital Private-Line" (DPL) radios, set encoder amplitude to zero by adjusting R342 (fully CCW from plating side of board).
3. Allow 20 minute warmup time for crystal heaters.

Frequency Adjustment Procedure

STEP	PROCEDURE
1	Select F1
2	Key transmitter with no modulation
3	Adjust L110 for F1 frequency ± 30 Hz
	Two-Frequency Models Only
4	Select F2
5	Adjust L111 for F2 frequency ± 30 Hz

IDC ADJUSTMENT

Oscillator frequency adjustment must be made *BEFORE* setting the IDC controls.

SET-UP

1. Set the deviation meter operating controls as needed.
2. *In tone coded "Private-Line" radios,* remove the "Vibrasponder" resonant reed from its socket on the PL board.

   In "Digital Private-Line" radios, set encoder amplitude to zero by adjusting R342 (fully CCW from plating side of board).
3. Connect the output of an audio signal generator to P100-6 as follows:

   High side through a 1 uF capacitor (+ end toward the radio) to P100-6. Low side to radio chassis ground.
4. Connect an ac voltmeter across the audio signal generator output.

NOTE

The transmitter must be keyed by pressing the KEY button on the test set or by shorting P6-3 to the radio chassis. DO NOT USE THE MICROPHONE PTT SWITCH TO KEY THE TRANSMITTER DURING IDC ADJUSTMENT.

IDC Adjustment Procedure

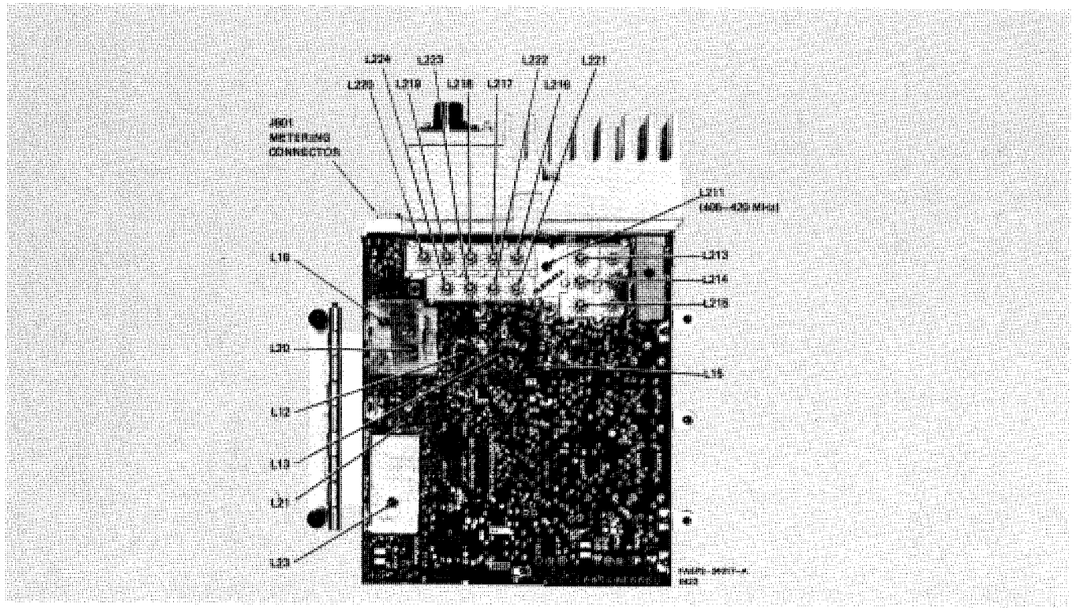
STEP	PROCEDURE
1.	Set audio signal generator output frequency to 1000 Hz and output level to 0.8 V.
2.	Select F1 and key transmitter. Adjust F1 "IDC" control R126 for ± 5 kHz deviation meter reading.
3.	On 2-freq. models, select F2 and key transmitter. Adjust F2 "IDC" control R136 for ± 5 kHz deviation meter reading.
4.	Reduce audio signal generator output level until deviation meter reads ± 3.0 kHz. Audio oscillator output level should be 160 mV ± 3 dB at P100-6 or 160 mV ± 6 dB at P4-2.
	Tone Coded "Private-Line" Models Only
5.	Insert resonant reed into socket on PL board and disconnect audio oscillator from P100-6.
6.	Key transmitter and adjust Tone Level control R433 for PL tone deviation reading of ± 750 Hz.
7.	Reconnect audio signal generator to P100-6 and repeat steps 1 through 3. Be sure overall deviation does not exceed ± 5 kHz, including PL tone.
	or
	"Digital Private-Line" Models Only (See Note)
5.	Disconnect the audio signal generator from P100-6.
6.	Key the transmitter and adjust Code Level set control R342 for a DPL code deviation reading of ± 750 Hz.
7	Reconnect the audio signal generator to P100-6. Repeat steps 5 and 6. Be sure overall deviation does not exceed ± 5 kHz, including DPL code. Repeat 1 through 3.

NOTE

DEVIATION MEASUREMENT

To obtain accurate measurement of transmitter deviation in radios equipped with "Digital Private-Line" binary-coded squelch, the frequency response of the deviation measuring equipment must be 1 Hz. If a deviation meter with this low frequency response characteristic is not available, the transmitter deviation can be checked by making the transmitter send continuous Turn-Off code during the measurement. Since the Turn-Off code waveform is sinusoidal, standard test equipment will then provide an accurate deviation measurement. To make the transmitter send continuous Turn-Off code, short together the base and emitter plating of PTT Inverter Q309 on the DPL board and key the transmitter.

UHF RECEIVER ALIGNMENT PROCEDURE



RECEIVER METERING

Typical Receiver Meter Readings With TEK-5 Metering Panel or S1056B Portable Test Set

METER	MEASUREMENT	READING, uA
1	IF Amplifier Signal Level	8-14 (No Signal) 50 (40 uV Input)
2	Quadrature Detector Output	22 ± 1 uA
3	Injection Oscillator Output	15-25 uA

Receiver Meter Readings With 20,000 Ohm/Volt Voltmeter

METERING POINT	VOLTMETER LEAD CONNECTIONS +	-	VOLT METE R SCALE	TYPICAL READINGS
M1 IF Ampl . Signal Level	J601-10	Chassis Ground	2.5 V DC	.25 - .5 V (No Signal) 1.75 V (40 uV Input)
M2 Quadrature Detector Output	J601-13	Chassis Ground	10 V DC	5.2 V ± .2 V
M3 Injection Osc. Output	J601-14	Chassis Ground	50 uA DC	15-25 uA

RECEIVER

PREALIGNMENT NOTES

1. On "Digital Private-Line" and "Private-Line" radio sets, disable the DPL or PL decoder by depressing the front panel MONITOR pushbutton; on remote only models actuate the PL MONITOR switch on the dc remote board.

2. In some cases, peak meter readings may occur at two points in the tuning range of a coil. Always choose point where the slug is nearest the top of the coil form (away from the circuit board).

3. Unnecessary tuning adjustments should be avoided. Usually, the receiver will require only a "touch-up" alignment. Complete receiver alignment is necessary in the following cases:

   a. After changing the receiver operating frequency.
   b. After replacing a component in a frequency-sensitive network.

4. Before beginning a complete receiver alignment, preset tuning adjustments as follows:

   a. Set L221, 222, 223, 224 nine turns CCW from fully in position.
   b. Set L213, 214, 215, 216, 217, 218, 219, 220 seven turns CCW from fully in position.
   c. Set L18, 20, 21, 23 flush with main circuit board.
   d. Set L211 flush with RF deck casting (406-420 MHz only).
   e. Set L12, 13, 15 flush with main circuit board.

5. Receiver frequency calculations:

   $$f_{osc} = \frac{f_c - 10.7\ MHz}{9} \text{ and } f_{inj} = 9f_{osc} = f_c - 10.7\ MHz;$$

   Where f_c = carrier frequency, $f_c = f_{osc}$ = oscillator crystal frequency, and f_{inj} = mixer injection freq.

6. Two-frequency radios should be tuned on the higher operatring frequency.

7. Check power supply voltage (13.8 V dc; ± 0.1 V)

8. Preset the SQUELCH control fully CCW. Depress MONITOR button and adjust OFF-VOLUME control for a comfortable listening level. On dc remote control models the service handset is required to listen to the receiver output.

TEST EQUIPMENT SET-UP

If a TEK-5 Metering Panel or a S1056B Portable Test Set is available, connect the metering panel or test set to J601 using the appropriate metering adapter cable. The metering adapter cables and directions for their use are shown. Metering may be accomplished with a 20,000 ohm-per-volt voltmeter if a test set or metering panel is not available. Refer to the voltmeter metering table on this page.

RECEIVER ALIGNMENT PROCEDURE

NOTE
Transmitter alignment must be performed before receiver alignment.

CAUTION
To prevent accidental destruction of the signal generator, remove the transmit crystal(s) and connect JU11 (on the local control board) to position "T" under these conditions receiver frequency can be changed by the F2 switch without actuating the PTT switch.

STEP	INPUT SIGNAL	SIGNAL INPUT POINT	ADJUST	MONITORING POINT	DESIRED READING
1 Quadrature Detector	10.7 MHz @ 1 mV	Near Q12; allow signal to "spray" into circuit (Note 1)	L23	Meter 2	22 ± 1 uA
				or	
				dc voltmeter at J601-13	5.8 V DC
2 Injection Oscillator			F2 Switch in "F1", adjust L13	Meter 3	Peak
			F2 Switch in "F2", adjust L12	Meter 3	Peak
			F2 Switch to lowest freq. position, then:		
			L15	Meter 3	Max
			L221		Peak
			L222		Dip
			L223		Peak
			L224		Dip
3 Preselector	Adjust unmodulated signal gen. to receive freq.	Antenna Connector	Set F2 Switch to highest freq. position, then adjust L220,219,218,217, 216		Peak.(Adjust signal generator output level to keep M1 in the 25 uA-35 uA range)
4 Preamp Input	Receive freq. (Note 2)	Antenna Connector	L213,214,215 L211(406-420 MHz)	Meter 1	Peak.(Adjust signal generator input level to keep M1 in the 25 uA-35 uA range)
5 IF Tuning	Receive Freq. (counted)	Antenna Connector	L18,20,21	Meter 1	Peak M1 with L18,20,21, then detune L21 1/2 turn ccw. (adjust signal level to maintain 25-35 uA on M1
6 Injection Touch-Up (lowest frequency)	Receive Freq.(no modulation) Adjust level for 30 uA reading on M1	Antenna Connector	L15	Meter 1	Detune CW for 20 uA reading on M1
			L224, 223, 222, 221; then repeat L15	Meter 1 Meter 3	Peak Peak
7 Fine Freq. Adj	Receive Freq.(counted)	Antenna Connector	L13 for freq #1 L12 for freq #2 (2 freq radios only)	Radio Speaker	Audio zero beat
	10.7 MHz Osc.	"Spray" into base of Q12 (Note 1)			
8 Final Touch-Up	Set to highest receive frequency (no modulation)	Antenna Connector	Detune CCW 1/2 turn L216, 217, 218, 219, 220. Next, peak L220, 219, 218, 217, 216,and 215 in descending order		Maximum M1 (Adjust signal level to maintain approx. 20-30 uA on M1
9 (406-420 MHz Only) Touch-Up for Widespace receive	Set to lower freq.	Antenna Connector	L213, 214, 215, 211, 216, 217, 218, 219, 220 in descending order.	M1	Peak (Adjust signal level to maintain approx. 20-30 uA reading
10. See note 3.					
11.	Spray 10.7 MHz to the base of Q12.	-	Readjust L23	M2	Adjust to level recorded in Step 10.

NOTES:
1. With a wire connected to a 10.7 MHz signal source output, "spray" the signal near Q12 (that is, place the wire in a close proximity to Q12) but do not allow the wire to make physical contact with any part of the i-f amplifier.

2. To set signal generator on frequency without a frequency counter, open receiver squelch and adjust the signal generator frequency until receiver quiets. Carefully adjust signal generator frequency for 22 uA meter 2 reading or for a 6.0 volt dc voltmeter reading at U10-6.

3. Momentarily reconnect the transmitter to a 50 ohm load. Key up, and record the meter 2 reading. Proceed with Step 11.

20 DB QUIETING SENSITIVITY MEASUREMENT

1. Connect an ac voltmeter across the speaker; on dc remote models, connect to P4 on dc remote board.
2. On PL model radio sets, disable PL by depressing the MONITOR button on the radio set from panel.
3. Turn the SQUELCH control fully counterclockwise.
4. Turn the radio set and adjust the VOLUME control until a reading of 2 volts is obtained on the ac voltmeter.
5. Connect an rf signal generator to the radio set antenna connector. Set the signal generator to the carrier frequency, and set the generator output level control to minimum.
6. Slowly increase the output level of the rf signal generator until the ac voltmeter reads 0.2 volts.
7. Note the signal generator output signal level. This signal level is the 20 dB quieting sensitivity of the receiver.

NOTE
For stations with the automatic line level adjust option, the signal generator output should be increased rapidly. If not, the agc action may produce erroneous results.

NOTES:

I. For optimum performance, diodes, transistors and integrated circuits must be ordered by Motorola part numbers.

II. When ordering quartz crystal units or ceramic resonators, specify carrier frequency, crystal (or resonator) frequency and crystal (or resonator) type number.

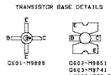
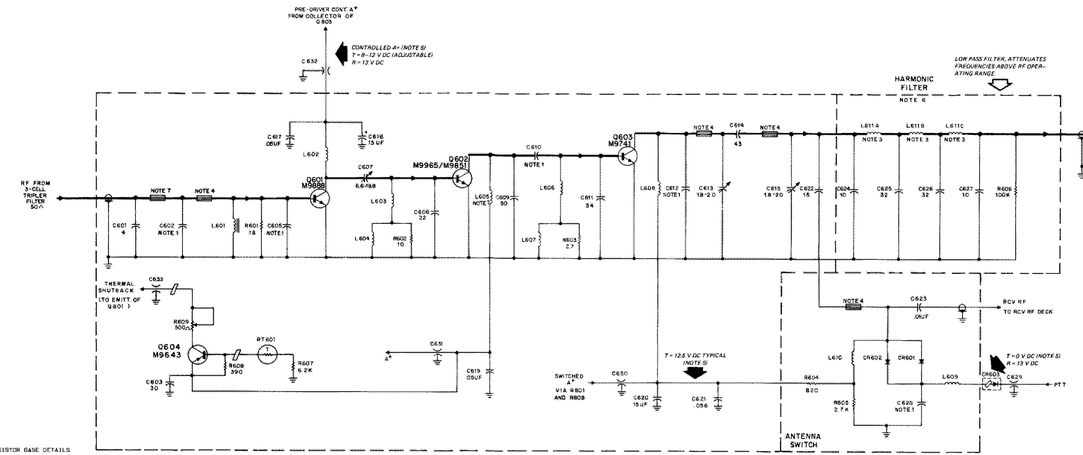
COMPONENT SIDE 80-DEPS-23692-O
SOLDER SIDE 80-DEPS-23693-O
DL-DEPS-23694-A

NOTE:
THE HARMONIC FILTER IS LOCATED IN A SHIELDED COMPARTMENT ACCESSABLE THROUGH THE REAR COVER OF THE HEATSINK.

TRANSISTOR BASE DETAILS





NOTES:

1. VALUE DEPENDS ON FREQUENCY BAND. REFER TO PARTS LIST FOR VALUE
2. UNLESS OTHERWISE STATED, RESISTOR VALUES ARE IN OHMS AND CAPACITOR VALUES ARE IN MICROFARADS.
3. INDUCTORS L611 ARE WIRES.
4. 50 OHM MICROSTRIP TRANSMISSION LINE.
5. THESE VOLTAGES ARE MEASURED WITH A+ 13.6 V DC.
6. THE HARMONIC FILTER COMPONENTS ARE MOUNTED IN A SHIELDED COMPARTMENT BETWEEN THE HEATSINK AND THE BACKPLATE COVER OF THE HEATSINK.
7. DISTRIBUTED ELEMENT; PART OF CIRCUIT BOARD PLATING.

LEGEND:
- THEORY NOTE
- MAINTENANCE NOTE
- PRIMARY SIGNAL FLOW

ANTENNA SWITCH ISOLATES RCVR INPUT DURING TRANSMISSION. THE 50 OHM MICROSTRIP LINE IS A 1/4 WAVELENGTH SECTION.

RECEIVE: PTT UNGROUNDED, CR601, 602 NON-CONDUCTING (OPEN CIRCUIT). 1/4 WAVE LINE 2 = 50 OHMS. PA OUTPUT CIRCUIT IS HIGH IMPEDANCE TO RECEIVED RF. RF PASSES TO RCVR RF INPUT.

TRANSMIT: PTT GROUNDED. CR601, 602 CONDUCT SHORT AT 1/4 WAVE LINE OUTPUT CAUSES "OPEN" AT LINE INPUT. XMTR RF IS BLOCKED FROM RCVR RF INPUT.

DEPS-22969-B

FUNCTION

Provides a filtered 30-watt (25 watt for 470-512 MHz band) frequency-modulated rf signal to the antenna; the antenna switch switches the antenna between the transmitter and the receiver.

1. VALUE DEPENDS ON FREQUENCY BAND. REFER TO PARTS LIST
2. UNLESS OTHERWISE STATED, RESISTOR VALUES ARE IN OHMS AND CAPACITOR VALUES ARE IN PICOFARADS.
3. INDUCTORS L608 ARE WIRES.
4. 50 OHM MICROSTRIP TRANSMISSION LINE.
5. THESE VOLTAGES ARE MEASURED WITH A+ = 13.8 V DC.
6. THE HARMONIC FILTER COMPONENTS ARE MOUNTED IN THE PA HEATSINK BENEATH THE PA CIRCUIT BOARD.
7. THE LEAD LENGTH OF D832 IS CRITICAL. WHEN REPLACING PART, TOTAL LEAD LENGTH SHOULD BE 3/8 INCHES LONG.

FUNCTION

Provides a filtered 15-watt frequency-modulated rf signal to the antenna; the antenna switches the antenna between the transmitter and the receiver.

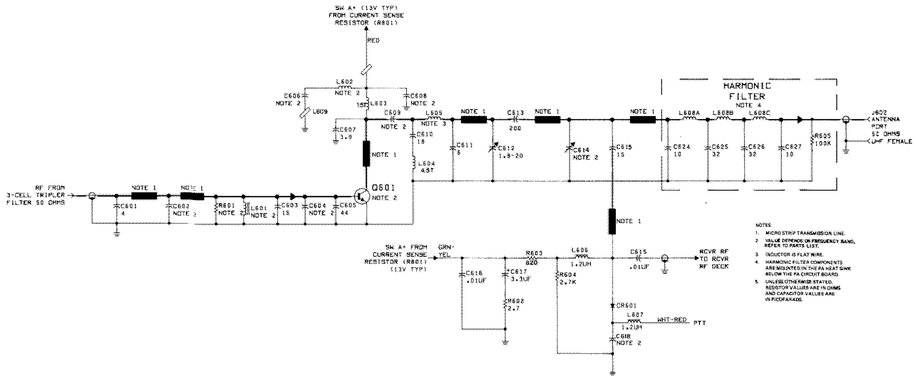
SHOWN FROM COMPONENT SIDE

2-WATT RF POWER AMPLIFIER HARMONIC FILTER, AND ANTENNA SWITCH

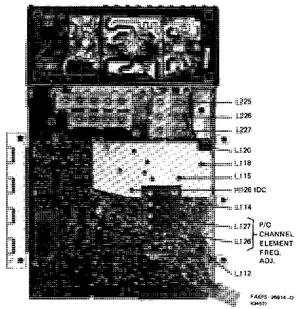
MODELS TLE1813A (450-470 MHz)
TLE1814A (470-494 MHz)
TLE1815A (494-512 MHz)

FUNCTION

Provides a filtered 2-watt frequency-modulated rf signal to the antenna; the antenna switch switches the antenna between the transmitter and the receiver.



TRANSMITTER



Transmitter Adjust Locations

TRANSMITTER METERING

TRANSMITTER METER READINGS, USING TEK-5 METERING PANEL OR S1056B PORTABLE TEST SET

METER	MEASUREMENT	READING, (uA)
3	2nd Buffer Amplifier Input	12 (TYP.))
5	Exciter Amplifier Collector Current	36 (TYP.))

TRANSMITTER METER READINGS WITH 20,000 OHM/VOLT VOLTMETER

METERING FUNCTION	VOLTMETER LEAD CONNECTIONS +	—	VOLTMETER SCALE	TYPICAL READING
M3 2nd Buffer Ampl. Input	J601-14	Chassis Ground	50 uA, DC	20 uA (TYP.)
M5 Exciter Output Amplifier Collector Current	J601-7	J601-11	150 mA, DC	110 mA (TYP.)

PREALIGNMENT NOTES

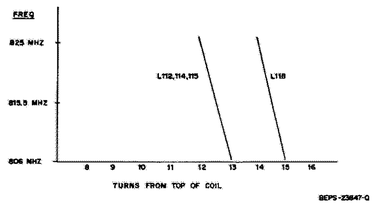
1. In some cases, peak readings may occur at two points in the tuning range of a coil. Always choose point where slug is nearest top of coil form (away from circuit board).

2. Unnecessary tuning adjustments should be avoided. Usually, only a "touch-up" transmitter alignment is needed. Complete transmitter alignment is needed in the following cases:

   a. After changing transmitter operating frequency.
   b. After replacing a component in a frequency-sensitive network.

3. Before beginning a complete alignment, preset tuning adjustments as follows:

   a. Set L120 8 turns from top of form.
   b. Starting with slugs of L225, 226, and 227 flush with tension nut, set slugs 4 turns above nut.
   c. Set L112, L114, L115, and L118 according to the following chart:



4. Key transmitter for each step in alignment procedure and de-key after alignment step is completed. Avoid keying an unaligned transmitter for prolonged periods.

5. Two-frequency radios should be aligned on lowest operating frequency.

6. Transmitter frequency calculations:

   $f_c = 18f_{osc}$, where f_c = carrier frequency, and f_{osc} = crystal oscillator frequency.

SET-UP

1. If a TEK-5 Metering Panel or a S1056B Portable Test Set is available, connect the metering panel or test set to J601 using the appropriate metering adapter cable. The metering adapter cables and directions for their use are shown in Figure 4. Metering may be accomplished with a 20,000 ohm-per-volt voltmeter if a test set or metering panel is not available. Refer to the metering tables on this page.

2. Connect an rf wattmeter, terminated in a resonant antenna or 50-ohm resistive dummy load, to radio set antenna connector J602.

3. Connect a dc power supply to the power leads of the test cable. Set the power supply output to 13.8 volts.

TRANSMITTER ALIGNMENT 800 MHz MAXAR

NOTES

1. Two-Frequency radios should be tuned on lowest frequency.

2. If repairs have been made on either the Final Amp or Power Doubler refer to servicing section for alignment procedure.

STEP	ADJUST	METERING POINT	DESIRED READING
1 1st Buffer Output	L112	M3	Peak
2 2nd Buffer Output	L114	M3	Dip if no M5 reading.
		M5	Peak if M5 has a reading (coincident with dip in meter 3).
3 First Tripler Output	L115, then L118	M5	Peak
4 Second Tripler Input	L120	M5	Dip M5
5 Second Tripler Output Filter	L225, L226, L227. Start with L226	Wattmeter	Peak
6 Second Tripler Input	L120	M5	Dip
7 Second Tripler Output Filter	L225, 226, 227	Wattmeter	Peak Detune L114 as necessary to maintain 8-10 watts while peaking.
8 2nd Buffer Output	L114	M5	Peak L114 on meter 5 coincident with Dip in meter 3.

NOTE

IF THE MAXIMUM POWER OUTPUT OBTAINABLE IS LESS THAN 12 WATTS:
Go back to Step 1 of the Transmitter Alignment Procedure and repeat the alignment a second time.

IF MAXIMUM IS LESS THAN 10 WATTS:
The transmitter may be malfunctioning. Refer to the transmitter schematic diagram for troubleshooting information.

TRANSMITTER ALIGNMENT PROCEDURE (Cont'd.)

OSCILLATOR FREQUENCY ADJUSTMENT

Oscillators should be set on frequency AFTER transmitter has been aligned and BEFORE modulation deviation is set.

SET-UP

1. Set up the frequency meter or counter controls as required.

2. *In tone-coded "Private-Line" (PL) radios,* remove the "Vibrasponder" resonant reed from its socket on the PL board.
   In "Digital Private-Line" (DPL) radios, set encoder amplitude to zero by adjusting R342 (fully CCW from plating side of board).

FREQUENCY ADJUSTMENT PROCEDURE

STEP	PROCEDURE
1	Select F1
2	Key transmitter with no modulation
3	Adjust L126 for F1 frequency ± 100 Hz at 25 °C ± 3 °C
	Two-Frequency Models Only
4	Select F2
5	Adjust L127 for F2 frequency ± 100 Hz at 25 °C ± 3 °C

NOTE

DEVIATION MEASUREMENT

To obtain accurate measurement of transmitter deviation in radios equipped with "Digital Private-Line" binary-coded squelch, the frequency response of the deviation measuring equipment must be less than 1 Hz. If a deviation meter with this low frequency response characteristic is not available, the transmitter deviation can be checked by making the transmitter send continuous Turn-Off code during the measurement. Since the Turn-Off code waveform is sinusoidal, standard test equipment will then provide an accurate deviation measurement. To make the transmitter send continuous Turn-Off code, short together the base and emitter plating of PTT Inverter Q309 and key the transmitter.

IDC ADJUSTMENT 800 MHz MAXAR

Oscillator frequency adjustment must be made BEFORE setting the IDC controls.

1. Set the deviation meter operating controls as needed.
2. *In tone coded "Private-Line" radios,* remove the "Vibrasponder" resonant reed from its socket on the PL board.
   In "Digital Private-Line" radios, set encoder amplitude to zero by adjusting R342 (fully CCW from plating side of board).
3. Disconnect mic input lead (red) from main circuit board.
4. Connect the output of an audio signal generator to J601 as follows:

   High side through a 1 uF capacitor (+ end toward the radio) to J601-5.
   Low side to J601-6 or radio chassis.

NOTE

The transmitter must be keyed by pressing the KEY button on the test set or by shorting J601-8 to J601-6 on the radio chassis. DO NOT USE THE MICROPHONE PTT SWITCH TO KEY THE TRANSMITTER DURING IDC ADJUSTMENT. The transmitter must be momentarily keyed with the handset or mic (depress F2 switch on front panel for F2 frequency) to change frequency on two freq stations.

5. Connect an ac VTVM across the audio signal generator output.

IDC ADJUSTMENT PROCEDURE:

STEP	PROCEDURE
1	Set audio signal generator output frequency to 1000 Hz and output level to 0.8 V.
2	Select F1 and key transmitter. Adjust F1 "IDC" control R126 for ± 5 kHz deviation meter reading.
3	On 2-freq. models, key transmitter and select channel (F1 or F2) that yields highest deviation. Adjust "IDC" control R126 for ± 5 kHz deviation meter reading on this channel.
4	Reduce audio signal generator output level until deviation meter reads ± 3.0 kHz. Audio oscillator output level should be 160 mV ± 3 dB.
	TONE CODED "PRIVATE-LINE" MODELS ONLY
5	Insert resonant reed into socket on PL board and disconnect audio oscillator from J601.
6	Key transmitter and adjust Tone Level control R433 for PL tone deviation reading of 800 Hz.
7	Reconnect audio signal generator to J601-5 and -6 and repeat Steps 1 through 3. Be sure overall deviation does not exceed ± 5 kHz, including PL tone.
	or
	"DIGITAL PRIVATE-LINE" MODELS ONLY (SEE NOTE)
5	Disconnect the audio signal generator from J601.
6	Key the transmitter and adjust Code Level set control R342 for a DPL code deviation reading of 900 Hz.
7	Reconnect the audio signal generator to J601-5 and -6. Repeat Steps 1 through 3. Be sure overall deviation does not exceed ± 5 kHz, including DPL code.

RECEIVER

PREALIGNMENT NOTES

1. On "Digital Private-Line" and "Private-Line" radio sets, disable the DPL or PL decoder by depressing the front panel MONITOR pushbutton.

2. In some cases, peak meter readings may occur at two points in the tuning range of a coil. Always choose point where the slug is nearest the top of the coil form (away from the circuit board).

3. Unnecessary tuning adjustments should be avoided. Usually, the receiver will require only a "touch-up" alignment. Complete receiver alignment is necessary in the following cases:

   a. After changing the receiver operating frequency.
   b. After replacing a component in a frequency-sensitive network.

4. Before beginning a complete receiver alignment, preset tuning adjustments as follows:

   a. Set L221, 222, 223, 224 5 turns CCW from fully in position.
   b. Set L213, 214, 215 5 turns CCW from fully in position.
   c. Set L216, 217, 218, 219, 220 4 turns CCW from fully in position.
   d. Set L15 15 turns from top of coil form.
   e. Set L18, 20, 21, 23 flush with top of coil form.

5. Receiver frequency calculations:

$$f_{osc} = \frac{f_c - 16.9\ MHz}{18} \quad \text{and} \quad f_{inj} = 18f_{osc} = f_c - 16.9\ MHz;$$

   Where f_c = carrier frequency, f_{osc} = oscillator crystal frequency, and f_{inj} = mixer injection freq.

6. Two-frequency radios should be tuned on the lower operating frequency.

TEST EQUIPMENT SET-UP

1. If a TEK-5 Metering Panel or a S1056B Portable Test Set is available, connect the metering panel or test set to J601 using the appropriate metering adapter cable. The metering adapter cables and directions for their use are shown in Figure 1. Metering may be accomplished with a 20,000 ohm-per-volt voltmeter if a test set or metering panel is not available. Refer to the voltmeter metering table on this page.

2. Connect a dc power supply to the power leads of the test cable. Set the power supply output to 13.8 volts.

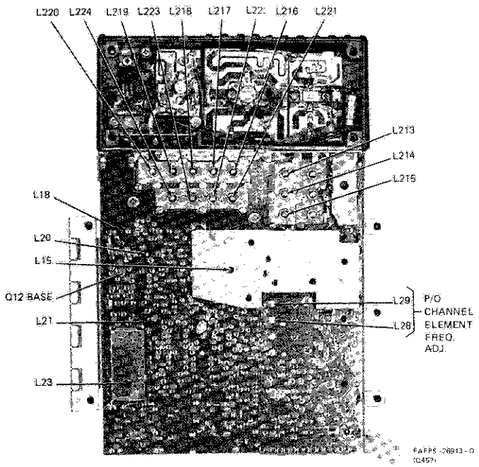


Figure 1. Receiver Adjustment Locations

RECEIVER METERING

TYPICAL RECEIVER METER READINGS WITH TEK-5 METERING PANEL OR S1056B PORTABLE TEST SET

METER	MEASUREMENT	READING, uA
1	2nd IF Amplifier Signal Level	16-22 (No Signal) 18-25 (20 dBq)
2	Quadrature Detector Output	22 ± 1
3	Injection Oscillator Output	10-28

RECEIVER METER READINGS WITH 20,000 OHM/VOLT VOLTMETER

METERING POINT	VOLTMETER LEAD CONNECTIONS +	VOLTMETER LEAD CONNECTIONS —	VOLTMETER SCALE	TYPICAL READINGS
M1 2nd IF Ampl. Signal Level	J601-10	Chassis Ground	2.5 V DC	0.5-0.8 V (No Signal) 0.6-0.9 V (20 dBq)
M2 Quadrature Detector Output	J601-13	Chassis Ground	10 V DC	5.2 V ± .2 V
M3 Injection Osc. Output	J601-14	Chassis Ground	50 uA DC	20-35 uA

RECEIVER ALIGNMENT PROCEDURE

RECEIVER ALIGNMENT PROCEDURE AND TEST EQUIPMENT LIST

NOTE

Transmitter alignment must be performed before receiver alignment.

STEP	INPUT SIGNAL	SIGNAL INPUT POINT	ADJUST	MONITORING POINT	DESIRED READING
1 Quadrature Detector	16.9 MHz @ 1 mV	Near Q12; allow signal to "spray" into circuit (Note 1)	L23	Meter 2	22 ± 1 uA
				or	
				VOM or VTVM at J1-13	5.3 V DC
2 Injection Oscillator			Freq Select Switch to lowest freq position, then:		
			L15	Meter 3	Max
			L221		Dip
			L222		Peak
			L223		Dip
			L224		Peak
3 Preselector	Receive freq @ 10 mV (Note 2)	Antenna Connector	1. Set Freq. Select Switch to lowest freq. position, then adjust L220, 219, 218, 217, 216. 2. Back out (CCW) all screws half turn and repeat peaking of L220-L216.	Meter 1	Peak. (Adjust signal generator input level to keep M1 in the 24 uA-35 uA range)
4 Preamp Input	Receive freq @ 10 mV (Note 2)	Antenna Connector	L213, 214, 215	Meter 1	Peak. (Adjust signal generator input level to keep M1 in the 25 uA-35 uA range)
5 Frequency Adjustment	Receive freq (counted)	Antenna Connector	L28 for freq F1 L29 for freq F2 (2 freq radios only)	Radio Speaker	Audio zero beat
		or			
	16.9 MHz Osc.	"Spray" into base of Q12 (Note 1)			
6 IF Tuning	Receive freq (counted)	Antenna Connector	1. L21, 20, 18 2. Repeat Peaking	Meter 1	Peak. (Adjust signal level to maintain 45-50 uA on Meter F1)
7 Final Injection Adjustment	Receive freq (no modulation)	Antenna Connector	L224, L220 thru L216, L213, 214, L215 in that order		Maximum quieting (Adjust signal level to maintain approx. 28 dBq)
8 Repeat Step 5					
9 Final Quadrature Adjust			Disconnect generator and connect 50 ohm load. Key transmitter on F1 and note Meter 2 reading. Inject 16.9 MHz from signal source and adjust L23 for same Meter 2 (±0.5 uA) as noted earlier.	Meter 2	Same Meter 2 in both transmitter and receiver ON mode.

NOTES:

1. With a wire connected to a 16.9 MHz signal source output, "spray" the signal near Q12 (that is, place the wire in close proximity to Q12) but do not allow the wire to make physical contact with any part of the i-f amplifier.
2. To set signal generator on frequency without a frequency counter, open receiver squelch and adjust the signal generator frequency until receiver quiets. Carefully adjust signal generator frequency for a 22 uA Meter 2 reading or for a 5.3 volt dc vtvm reading at U10-6.

20 dB QUIETING SENSITIVITY MEASUREMENT

1. Connect an ac vtvm across the speaker.
2. On PL model radio sets, disable PL by depressing the MONITOR button on the radio set front panel.
3. Turn the SQUELCH control fully counterclockwise.
4. Turn on the radio set and adjust the VOLUME control until a reading of 2 volts is obtained on the ac vtvm.
5. Connect an rf signal generator to the radio set antenna connector. Set the signal generator to the carrier frequency, and set the generator output level control to minimum.
6. Slowly increase the output level of the rf signal generator until the ac vtvm reads 0.2 volts.
7. Note the signal generator output signal level. The signal level is the 20 dB quieting sensitivity of the receiver.

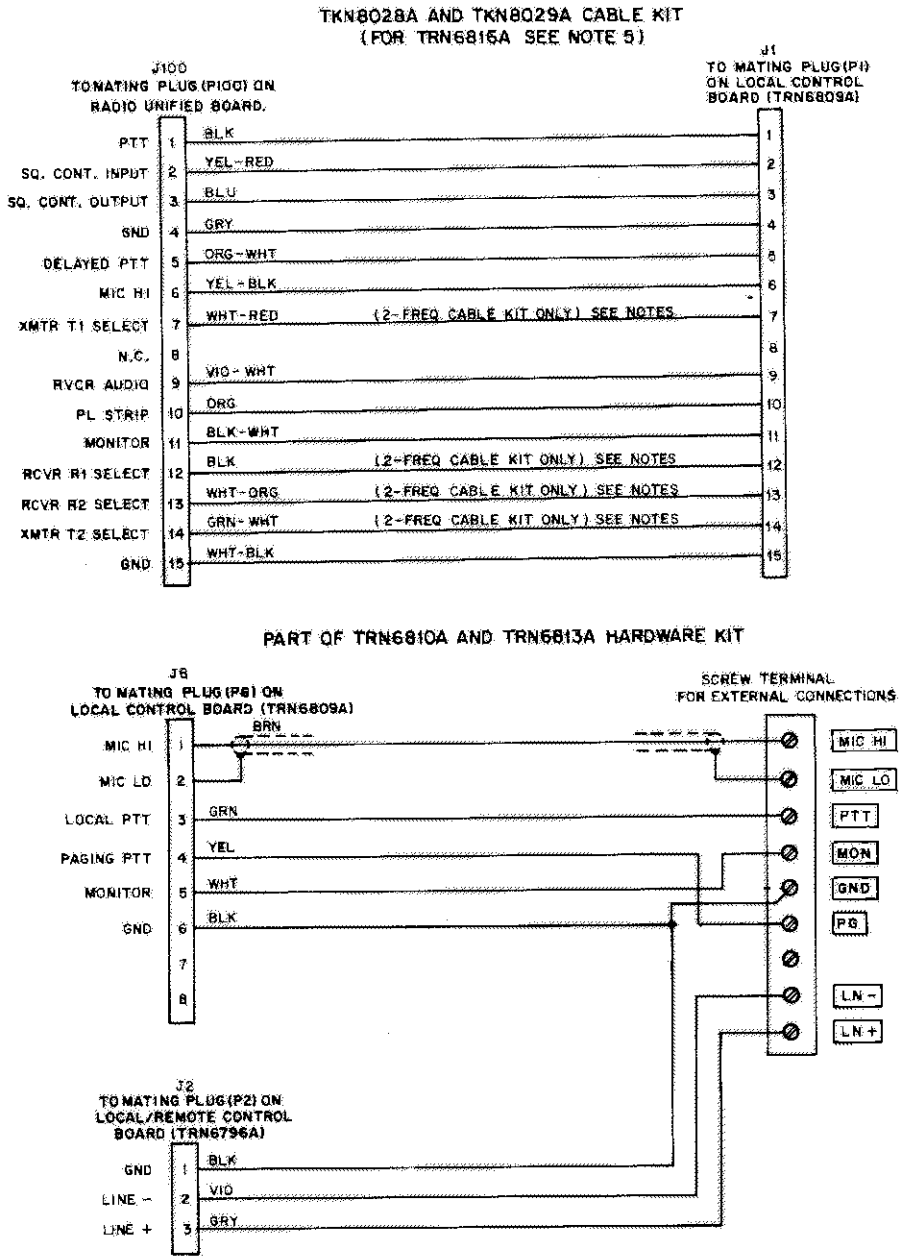
FLEXAR INTERCABLING DIAGRAM

INCLUDING SERVICE KIT TRN6816A



NOTES:

1. FOR TWO-FREQUENCY STATIONS WITH TWO TRANSMITTER CHANNEL ELEMENTS AND ONE RECEIVER CHANNEL ELEMENT USE TKN8028A CABLE KIT WITH THE FOLLOWING CHANGES.

JU1	IN – LOCATED ON UNIFIED CIRCUIT BOARD
JU101	OUT – LOCATED ON UNIFIED CIRCUIT BOARD
J1–PIN 13	CUT WHT–ORG WIRE AT J100–13 & TIE TO CABLE

2. FOR TWO-FREQUENCY STATIONS WITH TWO RECEIVER CHANNEL ELEMENTS AND ONE TRANSMITTER CHANNEL ELEMENT USE TKN8028A CABLE KIT WITH THE FOLLOWING CHANGES.

JU1	OUT – LOCATED ON UNIFIED CIRCUIT BOARD
JU101	IN – LOCATED ON UNIFIED CIRCUIT BOARD
J1–PIN 14	CUT GRN–WHT WIRE AT J100–14 & TIE TO CABLE

3. ALL WIRES ARE INCLUDED IN TKN8028A 2-FREQ. CABLE KITS. SEE JUMPER TABLE ON UNIFIED CIRCUIT BOARD DETAIL FOR STANDARD JUMPER CONFIGURATION.
4. IN TKN8029A ONE-FREQUENCY CABLE KITS WIRE FROM J1 PINS 7, 12, 13, AND 14 TO J100 ARE OMITTED. SEE JUMPER TABLE ON UNIFIED CIRCUIT BOARD DETAIL FOR STANDARD JUMPER CONFIGURATION.
5. THE TRN6816A SERVICE KIT CONSISTS OF A LONGER RADIO INTERCONNECT CABLE (1-1/2 FEET) AND POWER CABLE (2 FEET) AS WELL AS AN EXTENDER CARD FOR THE AUTO LEVEL OPTION AND THE 3 WATT AUDIO BOARD. WHEN USING THE TRN6816A SERVICE KIT, MODIFY THE RADIO INTERCONNECT CABLE PER NOTES 1 THROUGH 4.

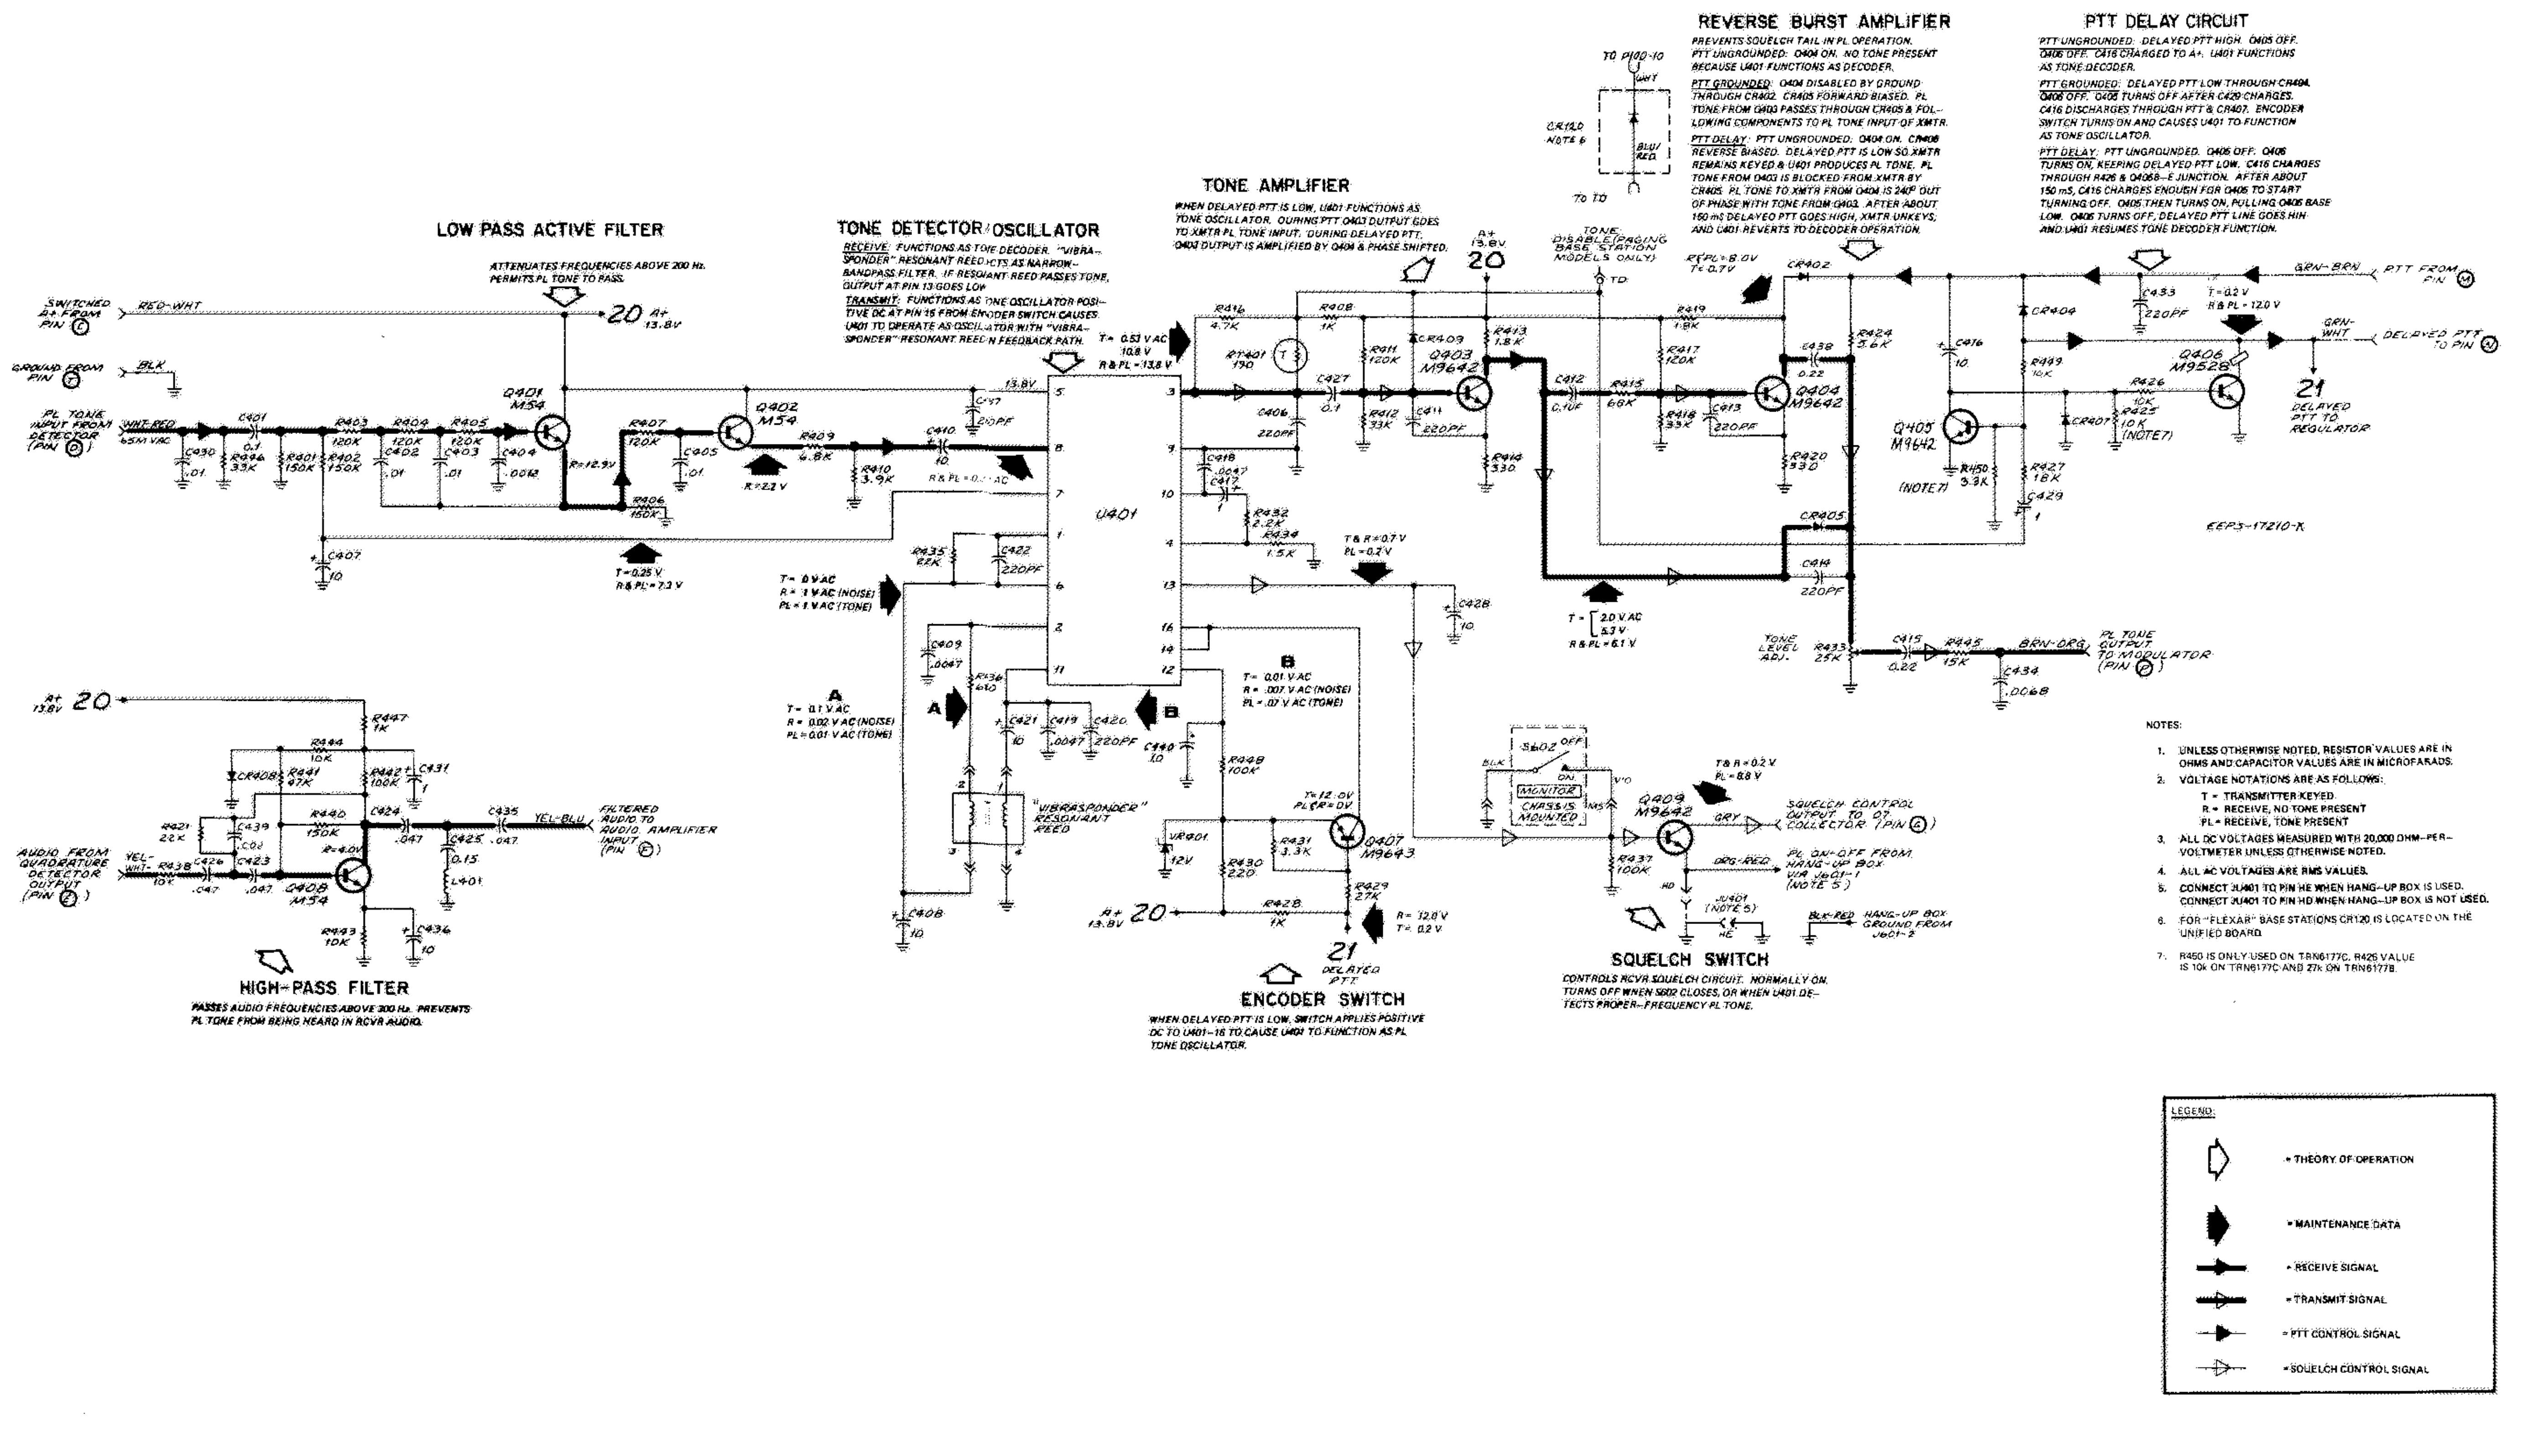
NOTE: For optimum performance, replacement diodes, transistors, and integrated circuits must be ordered by Motorola part number.



TONE "PRIVATE-LINE" ENCODER/DECODER

MODEL TRN6177C

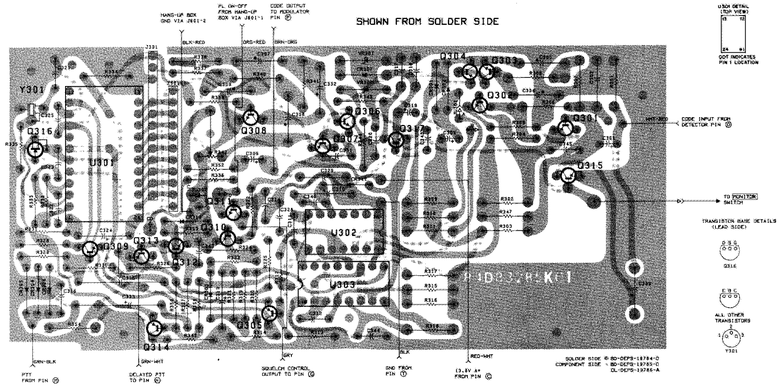
FUNCTION

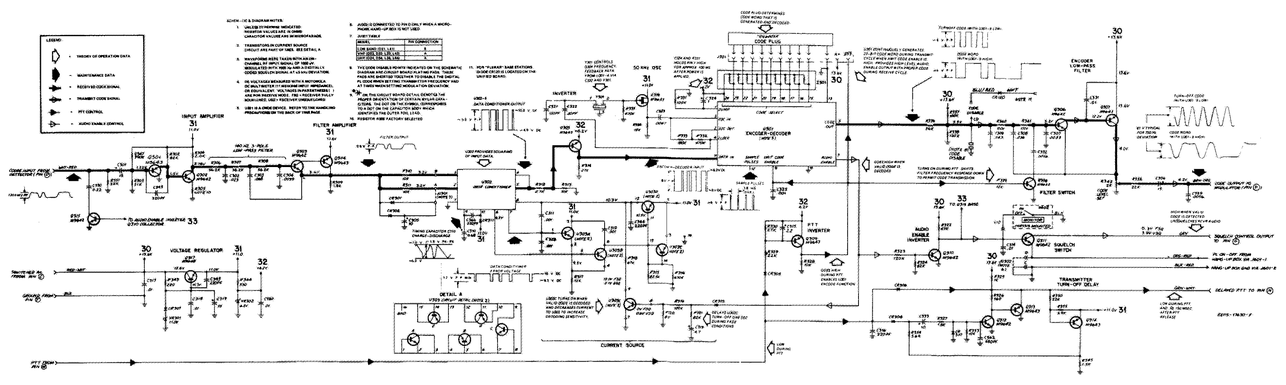
Encodes and decodes sub-audible "Private-Line" tones. Encoder modulates transmitter and delays transmitter turn-off 150 mS to allow transmission of turn-off reverse tone burst. Decoder detects received tone and unsquelches receiver when proper tone is received.

TONE "PRIVATE-LINE" ENCODER & DECODER

"DIGITAL PRIVATE-LINE" ENCODER/DECODER

MODEL TRN6207A





FUNCTION

Encodes and decodes "Digital Private-Line" codes. Encoder modulates transmitter and delays transmitter turn-off 150 mS to allow transmission of turn-off code. Decoder detects received tone and unsquelches receiver when proper code is received.

NOTES:

I. Replacement transistors must be ordered by Motorola part number only for optimum performance.

II. When ordering crystal units, specify carrier frequency, crystal frequency and crystal type number.

HANDLING PRECAUTIONS FOR CMOS INTEGRATED CIRCUITS

Many of the integrated circuit devices used in communications equipment are of the CMOS (Complementary Metal Oxide Semiconductor) type. Because of their high open circuit impedance, CMOS ICs are vulnerable to damage from static charges. Care must be taken in handling, shipping, and servicing them and the assemblies in which they are used.

Even though protection devices are provided in CMOS IC inputs, the protection is effective only against overvoltage in the hundreds of volts range such as are encountered in an operating system. In a system, circuit elements distribute static charges and load the CMOS circuits, decreasing the chance of damage. However, CMOS circuits can be damaged by improper handling of the modules even in a system.

To avoid damage to circuits, observe the following handling, shipping, and servicing precautions:

(1) Prior to and while servicing a circuit module, particularly after moving within the service area, momentarily touch both hands to a bare metal earth grounded surface. This will discharge any static charge which may have accumulated on the person doing the servicing.

(2) Whenever possible avoid touching any electrically conductive parts of the circuit module with your hands.

(3) Normally, circuit modules can be inserted or removed with power applied to the unit. However, check the INSTALLATION and MAINTENANCE sections of the manual as well as the module schematic diagram to insure there are no objections to this practice.

(4) When servicing a circuit module, avoid carpeted areas, dry environments, and certain types of clothing (silk, nylon, etc.) because they contribute to static buildup.

(5) All electrically powered test equipment should be grounded. Apply the ground lead from the test equipment to the circuit module before connecting the test probe. Similarly, disconnect the test probe prior to removing the ground lead.

(6) If a circuit module is removed from the system, it is desirable to lay it on a conductive surface (such as a sheet of aluminum foil) which is connected to ground through a resistance of approximately 100k.

WARNING

If the aluminum foil is connected directly to ground, be cautious of possible electrical shock from contacting the foil at the same time as other electrical circuits.

(7) When soldering, be sure the soldering iron is grounded.

(8) Prior to connecting jumpers, replacing circuit components, or touching CMOS pins (if this becomes necessary in the replacement of an integrated circuit device), be sure to discharge any static buildup as described in procedure 1. Since voltage differences can exist across the human body, it is recommended that only one hand be used if it is necessary to touch pins on the CMOS device and associated board wiring.

(9) When replacing a CMOS integrated circuit device, leave the device in its metal rail container or conductive foam until it is to be inserted into the printed circuit module.

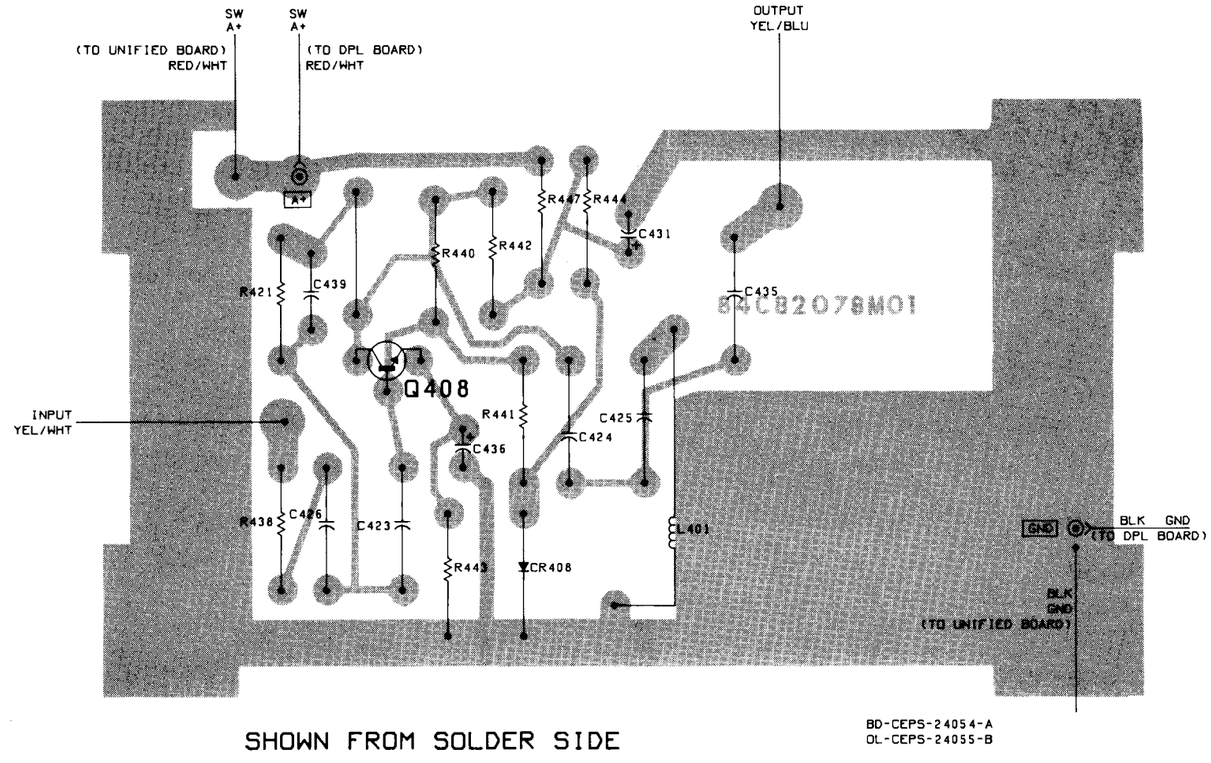
(10) All low impedance test equipment (such as pulse generators, etc.) should be connected to CMOS device inputs after power is applied to the CMOS circuitry. Similarly, such low impedance equipment should be disconnected before power is turned off.

(11) Replacement modules shipped separately from the factory will be packaged in a conductive material. Any modules being transported from one area to another should be wrapped in a similar material (aluminum foil may be used). NEVER USE NONCONDUCTIVE MATERIAL for packaging these modules.

EPS-18293-O

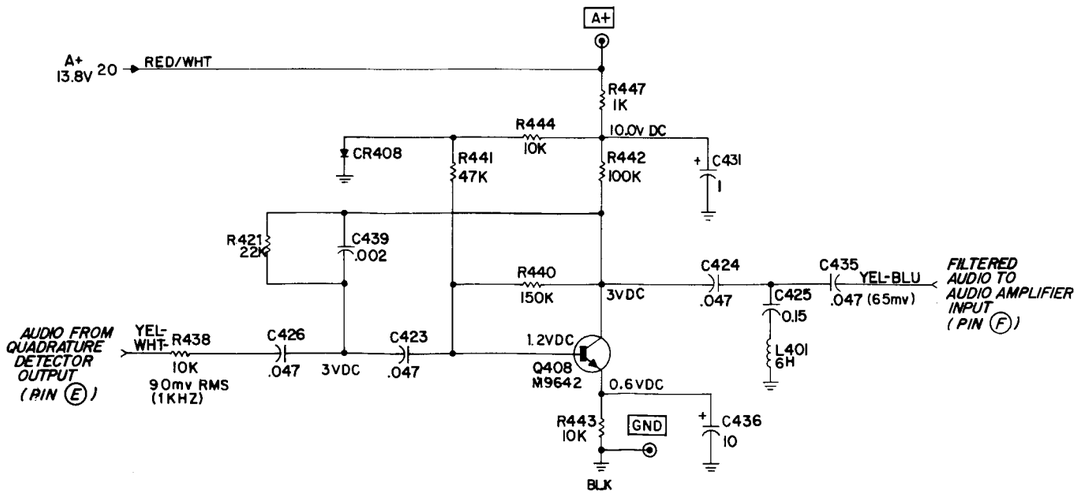
"DIGITAL PRIVATE-LINE" HIGH PASS FILTER

MODEL TRN8472A



SHOWN FROM SOLDER SIDE

BD-CEPS-24054-A
DL-CEPS-24055-B



HIGH-PASS FILTER

PASSES AUDIO FREQUENCIES ABOVE 300 Hz. PREVENTS PL/DPL TONE FROM BEING HEARD IN RCVR AUDIO

CEPS-24056-A

FUNCTION

Passes audio frequencies above 300 Hz. Attenuates coded squelch tones to prevent them from being heard in the receive audio.

FLEXAR CONTROL

FUNCTION

FLEXAR radios can employ local (front panel) and/or remote control. Control capabilities are determined by the radio model and optional features. Refer to the model and options charts for information on the control features of a particular model.

A functional block diagram is provided to show how local, local/remote or dc remote control operate with or without the automatic line level adjust option.

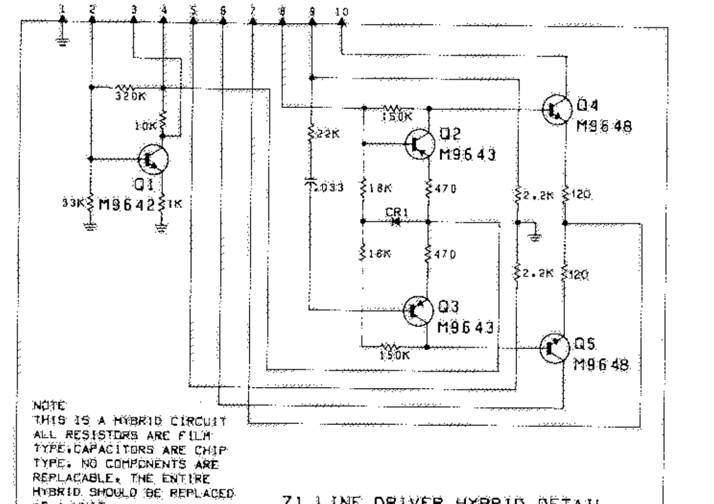
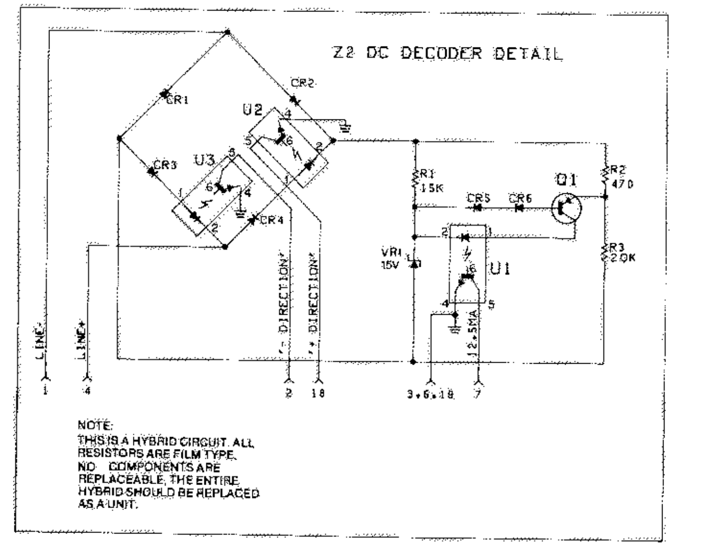
Z3 REMOTE INTERFACE HYBRID DETAIL



Z1 LINE DRIVER HYBRID DETAIL



LOCAL/REMOTE CONTROL BOARD

MODEL TRN6796A

FUNCTION

Provides remote control interface to operate radio when the REMOTE switch is depressed. Provides audio interface for remote controlling points.

JUMPER TABLE

JU1 - NORMALLY IN, OUT FOR LINE BRIDGING.
JU2 - NORMALLY IN, OUT WHEN AUTO LEVEL OPTION IS USED.
JU3, JU4 - NORMALLY OUT, - USED FOR SPECIAL APPLICATIONS.

NOTES:

1. ALL RESISTORS ARE IN OHMS, CAPACITORS ARE IN UF, UNLESS OTHERWISE STATED.
2. ALL DC VOLTAGES ARE MEASURED WITH A 20K/VOLTMETER.
3. ALL AC VOLTAGES ARE RMS, MEASURED WITH A HIGH IMPEDANCE METER. A 600-OHM LOAD IS ATTACHED ACROSS THE LINE.

   [ ] = MINIMUM LINE INPUT, -20 dBm
   ( ) = MAXIMUM LINE OUTPUT, +11 dBm

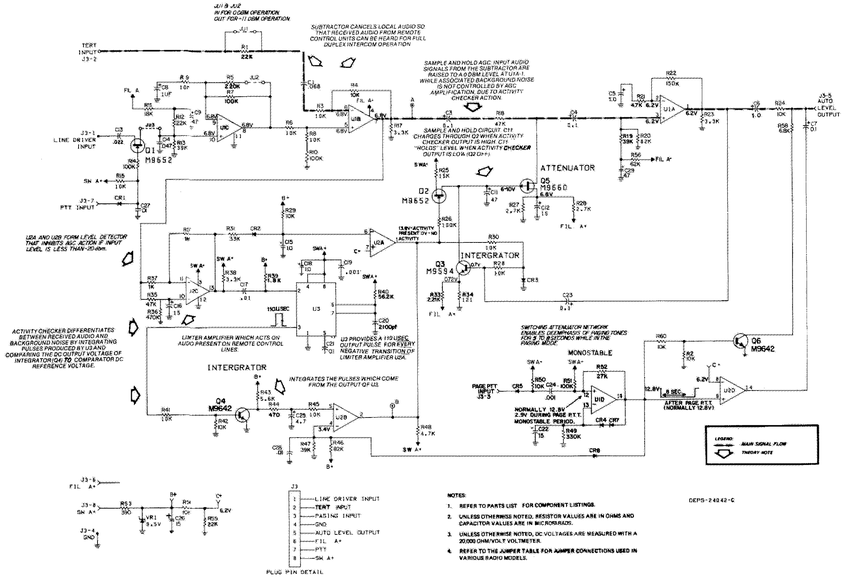
AUTO LEVEL BOARD

MODEL TRN6822A



NOTES:
1. REFER TO PARTS LIST FOR COMPONENT LISTINGS.
2. UNLESS OTHERWISE NOTED, RESISTOR VALUES ARE IN OHMS AND CAPACITOR VALUES ARE IN MICROFARADS.
3. UNLESS OTHERWISE NOTED, DC VOLTAGES ARE MEASURED WITH A 20,000 OHM/VOLT VOLTMETER.
4. REFER TO THE JUMPER TABLE FOR JUMPER CONNECTIONS USED IN VARIOUS RADIO MODELS.

FUNCTION

Provides constant audio output level for varying audio input levels from remote units. Gives full duplex intercom capability over transmission lines that present considerable path loss.

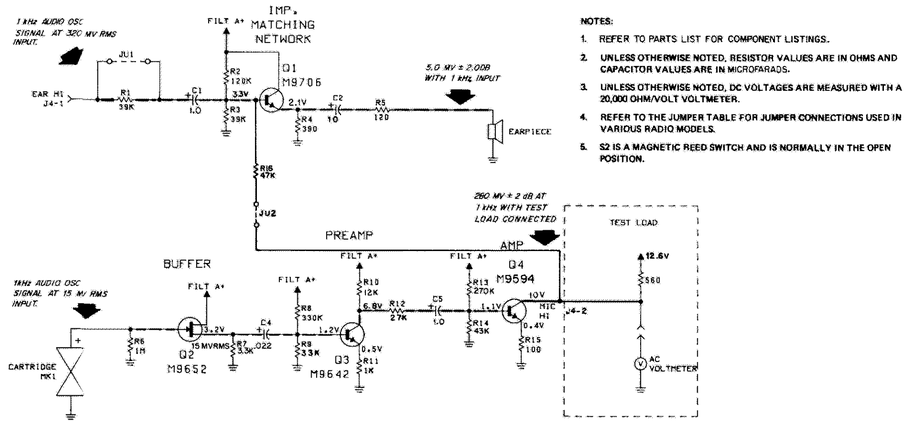
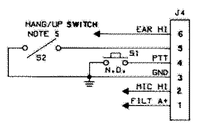
JU2	NORMALLY IN

JU1 USED FOR 10DB INCREASE IN EARPIECE LEVEL. (NORMALLY OUT)
JU2 USED FOR SIDETONE MIXING. (NORMALLY IN)



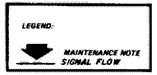
NOTES:

1. REFER TO PARTS LIST FOR COMPONENT LISTINGS.
2. UNLESS OTHERWISE NOTED, RESISTOR VALUES ARE IN OHMS AND CAPACITOR VALUES ARE IN MICROFARADS.
3. UNLESS OTHERWISE NOTED, DC VOLTAGES ARE MEASURED WITH A 20,000 OHM/VOLT VOLTMETER.
4. REFER TO THE JUMPER TABLE FOR JUMPER CONNECTIONS USED IN VARIOUS RADIO MODELS.
5. S2 IS A MAGNETIC REED SWITCH AND IS NORMALLY IN THE OPEN POSITION.



TMN1016A HANDSET MODEL COMPLEMENT

MODEL	DESCRIPTION
TRN6815A	PRE-AMP CIRCUIT BOARD
TRN6814A	HARDWARE KIT



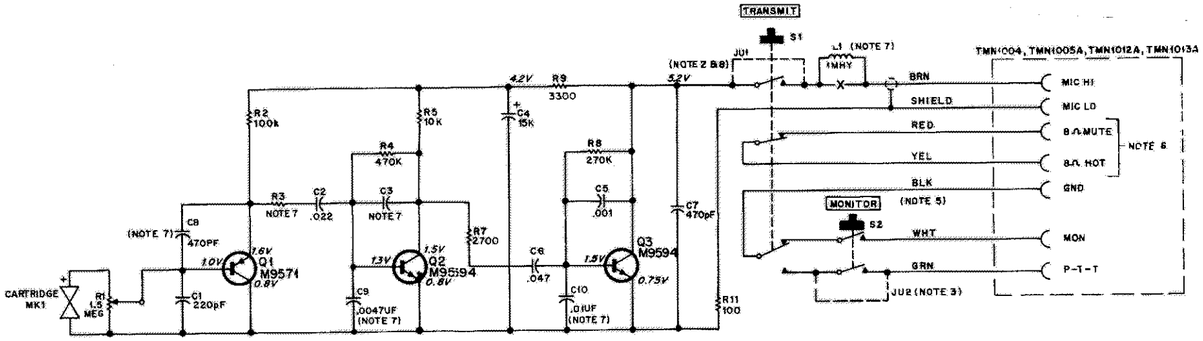
CEPS-24045-B

FUNCTION

Provides microphone audio amplification and provides earpiece audio for convenient handset operation.

DESK MICROPHONES

MODELS TMN1004A, TMN1005A, TMN1012A, TMN1013A, TMN1014A AND TMN1015A



NOTES:

1. UNLESS OTHERWISE STATED: ALL CAPACITOR VALUES ARE IN MICROFARADS.
2. REMOVE JU1 FOR PARALLEL MIC OPERATION. FOR TMN1012A & TMN1013A, CUT JU1 IF INTERCOM KIT IS USED.
3. REMOVE JU2 TO MONITOR BEFORE TRANSMIT.
4. ALL DC VOLTAGE READINGS ARE IN RESPECT TO THE MIC LO LEAD.
5. MONITOR SWITCH S2 IS PRESENT IN MODELS TMN1005A, TMN1013A AND TMN1015A ONLY.
6. ON LHB AND MHB SERIES "MOTRAC" LOCAL CONTROL BASE STATIONS WITH TLN1184B MONITOR INTERCOM, 8 MUTE CONNECTS TO TB1–3 (3 MUTE) AND 6 NOT CONNECTS TO TB1–6 (3 AUDIO LO) AND JUMPER TB1–6 TO GROUND.
7. THE FOLLOWING COMPONENT VALUES ARE MODEL–SENSITIVE:

REF. SYM.	TMN1004A AND TMN1005A	TMN1012A, TMN1013A TMN1014A, TMN1015A
R3	15k–1/4–10%	22k–1/4–5%
C9	.001	560 pF ±10%
C8	NOT USED	470 pF ±10%
C9	NOT USED	.0047 ±10%
C10	NOT USED	.01 ± 20%
L1	NOT USED	1 mHy

8. REMOVE JU1 FOR ANY CONSOLE WITH INTERCOM SINGLE–TONE OR ALERT–TONE APPLICATIONS.

CEPS-9460 - K

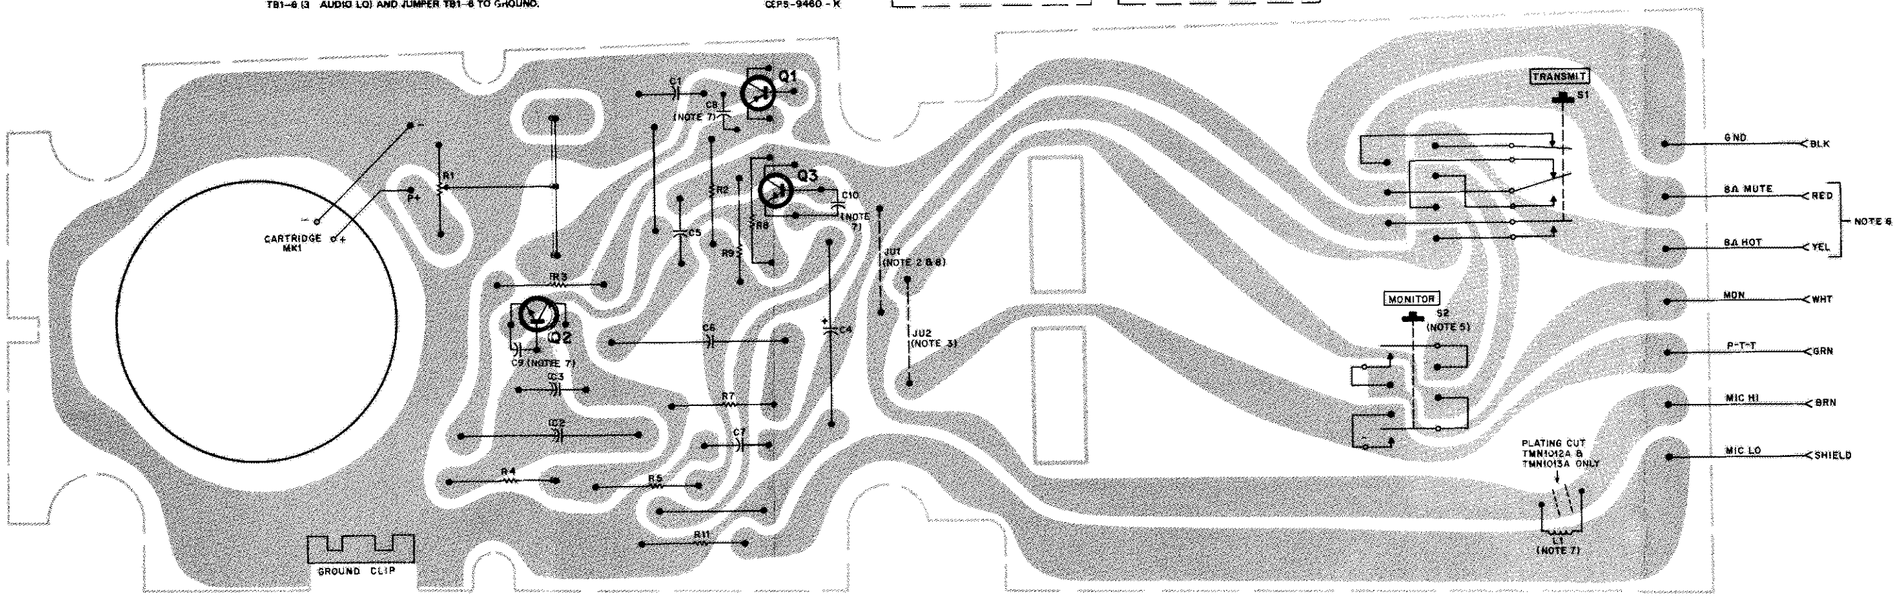
EPS-20626-O

APPLICATIONS

The desk microphones provide a desk surface self- supporting stand to mount the PTT and PL monitor switches and to support the dynamic cartioid microphone element at mouth level. The TMN1005A, TMN1013A and TMN1015A are used in "Private- Line" squelch systems and provides both PTT and monitor switches; the TMN1004A, TMN1012A and TMN1014A are used carrier squelch systems and uses only the PTT switch.



SHOWN FROM COMPONENT SIDE

TRANSISTOR DETAIL

DL-DEPS-9462-E

DESK MICROPHONE

CONNECTIONS

Lead Color	Function
Brown	Microphone High
Shield	Microphone Low
Green	PTT
White	Monitor
Black	Ground
Yellow*	Speaker Audio Hot
Red*	Speaker Audio Mute

*Use only when transmit monitor is desired at parallel-connected dispatch points when microphone is transmitting.

JUMPERS

Jumper JU1 is removed when parallel microphones or other local equipment are connected at the same microphone input. (For TMN1012A and TMN1013A, cut JU1 to systems without intercom.)

Jumper JU2 (Models TMN1005A and TMN1013A only) is removed when it is necessary to prevent an operator from transmitting without first monitoring a channel to verify it is clear. With JU2 removed, both the MONITOR and TRANSMIT switches must be activated before transmitting.

MAINTENANCE

NOTE

Potentiometer R1 is factory set and field adjustment is not required.

The microphone can be tested either while connected to its associated equipment or to the test setup as shown below. Basic testing consists of checking resistances and dc voltages against the schematic diagram. Dynamic testing can be accomplished by speaking into the microphone and using an oscilloscope or ac voltmeter to monitor the amplification (gain) of the various stages. However, since a known dynamic input signal for field testing is not practicable, gain measurements are to be used only as indications of proper stage functioning. For that reason, no ac voltages are provided on the schematic.
