DESCRIPTION

The MASTR Progress Line FM Transmitter Types ET-56-A and B are crystal-controlled, phase-modulated transmitters designed for one-, two-, or four-frequency operation within the 66-88 megacycle band. The transmitter consists of the following modules:

- Transistorized Exciter Board, with audio, oscillator, modulator, amplifier and multiplier stages,
- Tubed multiplier and power amplifier stages,
- Optional transistorized Channel Guard (ET-56-A only).

(RC-1191A)

Figure 1 - Transmitter Block Diagram

All input leads to the transmitter are individually filtered by the 20-pin feed-through by-pass connector J101. The output passes through a four-section, low-pass filter that features good shielding between sections and Teflon® capacitors for fail free operation with an open or shorted antenna.

CIRCUIT ANALYSIS

Six silicon transistors and only two tubes are used in the transmitter. When used with the mobile or station power supplies, the transmitter has a minimum power output of 30 watts. The frequency of the crystals used ranges from 5.5 to 7.3 megacycles, and the crystal frequency is multiplied 12 times.

A centralized metering jack (J102) is provided for use with General Electric Test Set 4EX3A10. The Test Set meters the multiplier, amplifier and PA stages as well as filament and regulated supply voltages. The metering jack also provides access to receiver audio, microphone and push-to-talk leads.

POWER INPUTS

The following supply voltages are connected from the power supply to the transmitter through the 20-pin by-pass connector J101:

Pin 3 - Filament voltage

Pin 4 - +300 volts MULT B+

Pin 5 - +450 volts PA B+

Pin 8 - -45 volts bias

Pin 14 - +10 volts for Channel Guard option (ET-56-A only).

Pin 15 - -20 volts for exciter board.

OSCILLATOR

A transistorized Colpitts oscillator (Q3) is used in the transmitter. The oscillator crystal is thermistor compensated at both ends of the temperature range to provide instant frequency compensation with a frequency stability of $\pm 0.0005\%$ without crystal ovens or warmers.

In single-frequency transmitters, a jumper (from H1 to H2) connects the F1 crystal keying lead to ground to forward bias diode CR3. Forward biasing the diode reduces its impedance, and the crystal frequency is applied to the base of oscillator Q3. Feedback for the oscillator is developed across C41. The oscillator output is coupled directly to the phase modulator.

In multi-frequency transmitters, the single oscillator transistor is used, and up to three additional crystal circuits, identical to the F1 crystal circuit, can be added. The keying jumper is removed and the proper frequency is selected by switching the crystal keying lead to ground by means of a frequency selector switch on the Control Unit.

AUDIO AMPLIFIERS AND LIMITER

An audio signal from the microphone is coupled through C1 to the base of Class A audio amplifier Q1. The design of the microphone, in conjunction with C2 and R3, produces a 6-db audio pre-emphasis. R48 and C74 provides RF de-coupling.

The amplified audio signal is RC-coupled to the diode limiters, CR1 and CR2. These diodes operate in series and are normally in a forward conducting state. An audio signal of sufficient amplitude to cause limiting takes the diodes out of conduction, so that one diode conducts only on positive cycles and the other conducts only on negative cycles.

Following the limiter stage is a second Class A amplifier, Q2. The output of Q2 is coupled through MOD ADJUST potentiometer R14 to a combined post-limiter filter and de-emphasis network. This network consists of R17, R18, R19, C5, C8, C9 and C49. The output of the filter and de-emphasis network is applied directly to the phase modulator.

PHASE MODULATOR

The phase modulator is a varactor (voltage-variable capacitor) CV-1, in series with tuneable coil L1. This network appears as a series-resonant circuit to the RF output of the oscillator. An audio signal applied to the modulator varies the bias of CV-1, resulting in a phase modulated output. The output of the modulator is coupled through blocking capacitor C51 to the base of the first amplifier. For Channel Guard and Wide Band transmitters, a second modulator stage (L2 and CV-2) is cascaded with the first modulator. The output of the Channel Guard encoder is fed through CHANNEL GUARD MOD ADJUST R20 to the modulator stages. The voice audio is also applied to both modulator stages.

AMPLIFIERS AND MULTIPLIERS

The first amplifier (Q4) isolates the modulator from the loading effects of the first multiplier and provides amplification. The output is DC-coupled to the first multiplier. Metering resistor R41 permits the MULT-1 stage to be metered at centralized metering jack J102-10.

Following Q4 are two inductively coupled Class C, common-emitter multiplier stages (Q5 and Q6). Q5 is a tripler, with collector tank L3 tuned to three times the crystal frequency.

Q6 operates as a doubler stage, with collector tank T1 tuned to six times the crystal frequency. Resistor R43 is for metering the MULT-2 stage at J102-2.

MULT-3

The output of the transistorized Exciter is coupled by a short length of RF cable to the grid tank (L12/L13) of beam pentode V1. This stage operates as a doubler with the plate tank tuned to 12 times the crystal frequency.

The grid of V1 is metered through metering resistors R1 and R2 at J102-4. The combination of R1, R2 and R3 drops the bias voltage to approximately -11 volts to protect V1 against loss of drive. Plate voltage is supplied through R7 and L1/L2.

When measuring grid current to V1, there will be a residual reading of approximately 0.16 volts without any drive. This is caused by the presence of fixed bias voltage to the grid of the tube.

POWER AMPLIFIER

The output of the MULT-3 stage is coupled to the grid of the compactron beam power amplifier (V101) through L5/L6, and is metered at J102-6 and J102-14 by measuring voltage drop across R10. Bias voltage (-45 volts) is applied to the PA grid through R9 and L7/L8. There is no residual reading on the PA.

Plate current is metered from J102-1 to J102-9 across metering resistor R101. Plate voltage is supplied through L101, and the PA plate tank is shunt-tuned by capacitor C110. R13 and R14 are the screen grid dropping resistors.

WARNING

The meter leads are at plate potential (high B+) when metering the PA plate at J102-1 and J102-9.

Placing the TUNE-OPERATE switch (S102) in the OPERATE position applies 300 volts to A143/A144-J3 and -J7. The 300 volts appearing on each side of R12 effectively shorts the resistor out of the circuit, and R13 and R14 are in series for normal operation of V101. When S102 is in the TUNE position, the screen voltage is applied to J3 only. Now, dropping resistors R12, R13 and R14 are in series to reduce the screen voltage. This reduces the plate dissipation of V101 while tuning the power amplifier stage. Feedback through capacitor C115 and C122 neutralizes the stage.

Antenna coupling is achieved by varying the coupling between L108 and L113. C111 tunes the antenna circuit.

The RF output from the antenna coil is fed to low-pass filter FL104/FL105. This filter has a low insertion loss and a harmonic attenuation of at least -50 db through all harmonics. The filter output is fed to the antenna changeover relay located on the front of the system frame.

CHANNEL GUARD TRANSMITTER (G101)

The Channel Guard encoder is assembled on a printed wiring board that mounts on the underside of the MASTR transmitter. The Encoder is supplied by a regulated 10 volts and a regulated 20 volts. The 10-volt supply is applied to Q1 and Q2 continuously (even in the STANDBY position), and the 20 volts is applied to Q3 and Q4 only when the transmitter is keyed.

Transistors Q1 and Q2 with reed FL1 are the tone oscillator portion of the circuit. The reed is resonant at the desired tone frequency. Clipping diodes CR1 and CR2 shape the output of the oscillator circuit into a square wave, which is coupled through the Channel Guard TONE ADJUST control (R12 to the base of Q3). R12 will not require adjustment unless the Channel Guard tone frequency is changed. Then R12 must be set to the new reed frequency.

Q3 and Q4 form a two-section low-pass filter that removes the distortion in the square wave, producing a sine wave output. The square wave oscillator output has a constant amplitude, making the encoder less sensitive to shock and vibration. The encoder tone is fed to the tone modulator on the Exciter Board through Channel Guard MOD ADJ R34.

The channel can be monitored by moving the CG-OFF switch on the Control Unit to the OFF position (or by removing the microphone or handset from the optional hang-up bracket).

NOTE

If the Two-Way Radio is mounted vertically or at an angle of over 45°, rotate the encoder reed 90° in its mounting bracket so that the label with the G-E Drawing and Part Number is facing the rear of the Two-Way Radio. See Figure 3 for location of the encoder reed.

MAINTENANCE

DISASSEMBLY

To service the transmitter from the top—

1. Pull locking handle down and pull radio about one inch out of mounting frame.
2. Pry up cover at rear of transmitter.
3. Slide cover back and lift off.

Figure 2 - Top Cover Removed

To service the transmitter from the bottom—

1. Pull locking handle down. Pull radio out of mounting frame.
2. Remove two screws in bottom cover. Pry up at back of transmitter.
3. Slide cover back and lift off.

Figure 3 - Bottom Cover Removed

NOTE

To replace tubes, loosen screws holding tube shields and slide shields off.

To remove transmitter from system frame—

1. Loosen the two retaining screws in the front casting (see Figure 2) and pull casting away from the system frame.
2. Remove the four screws in the back cover.
3. Remove the two screws holding the transmitter at each end of the system frame.
4. Disconnect the antenna jack in front of the transmitter and the 20-pin feed-through connector at the back of the transmitter, and slide the unit out of the system frame.

MODULATION LEVEL ADJUSTMENT

The MOD ADJUST (R14) was adjusted to the proper setting before shipment and should not normally require readjustment. This setting permits approximately 75% modulation for the average voice level. The audio peaks which would cause overmodulation are clipped by the modulation limiter. The limiter, in conjunction with the de-emphasis network, instantaneously limits the slope of the audio wave to the modulator, thereby preventing overmodulation while preserving intelligibility.

TEST EQUIPMENT

- 1. An audio oscillator
- 2. A frequency modulation monitor
- 3. An output meter or a VTVM
- 4. G-E Test Set, Model 4EX3A1

PROCEDURE

- 1. Connect the audio oscillator and the meter across audio input terminals J5 (Green-Hi) and J6 (Black-Lo) on G-E Test Set or across J1 (Mike High) and J2 (Mike Low) on the Exciter Board.
- 2. Apply a 1.0-volt signal at 1000 cps to Test Set or across J1 and J2 on Exciter Board.
- 3. For transmitters without Channel Guard, set the MOD ADJUST (R14) for a 4.5-kilocycle swing (13.5 KC for Wide Band) with the deviation polarity which gives the highest reading as indicated on the frequency modulation monitor.
- 4. For transmitters with Channel Guard, set the Channel Guard MOD ADJUST (R20) for 0.75-KC tone deviation. Then repeak L1/L2 and L3/L4 as shown in Step 1 of Transmitter Alignment Procedure. Reset tone deviation to 0.75 KC deviation. Remove the tone to the transmitter by unplugging leads to J7 and J8 on Exciter Board, or by switching to a non-Channel Guard frequency in multi-frequency units. Next, apply a 1.0 volt signal at 1000 cps and set MOD ADJUST (R14) for 3.75-KC deviation (4.5-KC minus 0.75-KC tone deviation).
- 5. For multifrequency transmitters, set the deviation as described in steps 3 or 4 on the channel producing the largest amount of deviation.

PA POWER INPUT

For FCC purposes, the PA power input can be determined by measuring the PA Plate voltage and the plate current indication, and using the following formula:

P_i = $\frac{\text{Plate Voltage} \times \text{Plate Current Indication}}{4.67}$

where:

P_i is the power input in watts.

Plate voltage is measured with G-E Test Set in position G, using the 1000-volt scale (or measured from J102-1 to -16 with multimeter).

Plate current indication is measured with G-E Test Set in Position G, using the TEST 1 scale (or measured from J102-1 to -9 with multimeter).

4.67 is the value of the plate current metering resistor in ohms.

TRANSMITTER ALIGNMENT

EQUIPMENT REQUIRED

- 1. General Electric Centralized Metering Test Set Model 4EX3A10, Station Meter Switching Panel, or a 20,000 ohms-per-volt Multimeter with a 1-volt scale.

PRELIMINARY CHECKS AND ADJUSTMENTS

- 1. Place crystal (operating frequency \pm 12) in crystal socket XY1.
- 2. Set crystal trimmer C11 to mid-capacity. If multi-frequency transmitter, set all trimmers to mid-capacity and tune transmitter on channel with the highest frequency (except for Step 7).
- 3. Place the TUNE-OPERATE switch (S102) in the TUNE position.
- 4. Connect Test Set Model 4EX3A10 to the Transmitter Centralized Metering Jack J102. If using Multimeter, connect the positive lead to J102-16 (Ground) except for Steps 6 through 14.
- 5. For a large change in frequency or a badly misaligned transmitter, set the slugs in all slug-tuned coils in the center of the coil form. All slugs will then tune clockwise, except MULT-3 PLATE and PA GRID slugs which tune counter-clockwise.
- 6. All adjustments are made with the transmitter keyed.

EXCITER BOARD					
1.	A (MULT-1)	Pin 10	L1 (and L2 with Channel Guard)	0.6 v (0.4 v Minimum)	Tuning the modulator is a critical adjustment. Carefully tune L1 for maximum meter reading. For Channel Guard or Wide Band transmitters alternately tune L1 and L2 for maximum meter reading.
2.	A (MULT-1)	Pin 10	L3	See procedure	Tune L3 for a small peak in meter reading (not required unless changing frequency).
3.	B (MULT-2)	Pin 2	L4 and L3	0.65 v (0.4 v Minimum)	Tune L4 and then L3 for maximum meter reading. Then tune T1 for minimum meter reading (not required unless changing frequency). NOTE Misalignment of this coil may result in the remainder of the transmitter being tuned off frequency. Always start with the slug in the center of the coil form (at maximum inductance) and tune for the first peak.
MULT-3 AND POWER AMPLIFIER					
4.	D (MULT-3)	Pin 4	MULT-3 GRID and T1 (on Exciter)	0.55 v (0.4 v Minimum)	Alternately tune MULT-3 GRID and T1 (on Exciter) for maximum meter reading. Then tune MULT-3 PLATE for slight change in meter reading (not required unless changing frequency).
5.	F (PA GRID)	Pin 14 (+) and Pin 6 (-)	PA GRID and MULT-3 PLATE	0.45 v (0.4 v Minimum)	Alternately tune PA GRID and MULT-3 PLATE for maximum meter reading.
6.					Rotate ANT COUPLING fully counterclockwise.
7.	G (PA PLATE)	WARNING High B-plus on Pins 1 and 9.		Minimum	For single-frequency transmitters, carefully tune PA PLATE for minimum meter reading. For multi-frequency transmitters, switch to the lowest frequency and adjust PA PLATE for minimum meter reading.
8.		Pin 1 (+) and Pin 9 (-)	PA PLATE		
9.	G (PA PLATE)	Pin 1 (+) and Pin 9 (-)	ANT COUPLING	See procedure	Place S102 in the OPERATE position. Rotate ANT COUPLING clockwise until meter reading rises slightly. In multi-frequency transmitters, switch back to the highest frequency before tuning ANT COUPLING.
10.	G (PA PLATE)	Pin 1 (+) and Pin 9 (-)	ANT TUNING	Maximum	Adjust ANT TUNING for maximum meter reading.
11.	G (PA PLATE)	Pin 1 (+) and Pin 9 (-)	ANT COUPLING	0.7 v	Adjust ANT COUPLING for metering reading of 0.7 volts.
12.	F (PA GRID)	Pin 14 (+) and Pin 6 (-)	PA GRID	Maximum	Readjust PA GRID for maximum meter reading.
FREQUENCY ADJUSTMENTS					
13.			C11 (C18, C25 and C32 in multi-frequency units)		With no modulation, adjust crystal trimmer C11 (on Exciter) for proper oscillator frequency. In multi-frequency units, adjust C18, C25 and C32 as required. Next, refer to the MODULATION ADJUSTMENT. NOTE For proper frequency control of the transmitter, it is recommended that all frequency adjustments be made when the equipment is at a temperature of approximately 75°F. In no case should frequency adjustments be made when the equipment is outside the temperature range of 50° to 90°F.

TEST PROCEDURES

These Test Procedures are designed to assist you in servicing a transmitter that is operating--but not properly. Problems encountered could be low power output, low B plus, tone and voice deviation, defective audio sensitivity and modulator adjust control set too high. By following the sequence of test steps starting with Step 1, the defect can be quickly

localized. Once a defect is pin-pointed, refer to the "Service Check" and the additional corrective measures included in the Transmitter Troubleshooting Procedure. Before starting with the Transmitter Test Procedures, be sure the transmitter is tuned and aligned to the proper operating frequency.

TEST EQUIPMENT REQUIRED

for test hookup as shown:

1. Wattmeter similar to:
Bird #43
Jones #711N
2. VTVM similar to:
Triplett #850
Heath #1M-21
3. Audio Generator similar to:

Heath #1G-72
4. Deviation Meter (with a .75 KC scale) similar to:
Measurements #140
Lampkin #205A
5. Multimeter similar to:
G-E METERING TEST SET MODEL 4EX3A10 or
Triplett #631 or
20,000 ohms-per-volt voltmeter

STEP 1

POWER MEASUREMENT
TEST PROCEDURE

1. Connect transmitter output to wattmeter as shown below:

2. Key transmitter and check wattmeter for minimum reading of 30 watts.

SERVICE CHECK

Refer to Service Hints on Transmitter Troubleshooting Procedure.

STEP 2

TONE DEVIATION WITH CHANNEL GUARD
TEST PROCEDURE

1. Setup Deviation Meter and monitor output of transmitter as shown below:

2. Unplug the MIC HI terminal from J1 or Transmitter Exciter Board.
3. Key transmitter and check for 0.75-KC deviation. If reading is low or high, adjust Channel Guard MOD ADJUST (R20) for a reading of 0.75 KC.

NOTES:

The Channel Guard MOD ADJUST (R20) may be adjusted for deviations up to 0.80 KC for tone frequencies from 71.9 cps to 82.5 cps, and deviations up to 1.0 KC for all tone frequencies above 82.5 cps.

DEVIATION METER

NOTES:

1. On units supplied with Channel Guard, the Phase Modulator Tuning should be peaked carefully to insure proper performance. (Refer to Steps 1 and 2 in the Transmitter Alignment Chart).
2. The Tone Deviation Test Procedures should be repeated every time the Tone Frequency is changed.

SERVICE CHECK

If the 0.75-KC deviation is not obtainable when adjusting R20, replace the Tone Transmitter reed.

STEP 3

VOICE DEVIATION AND SYMMETRY
TEST PROCEDURE

1. Unplug the High and Low Mike leads from the Exciter Board Jacks J1 and J2.
2. Connect test equipment to transmitter as shown below:

3. Set the generator output to 1.0 VOLTS RMS and frequency to 1 KC.
4. Key the transmitter and adjust Deviation Meter to carrier frequency. Deviation reading should be +4.5 KC (+13.5 KC wide band).
5. Adjust "Modulation Adjust Control" R14 until deviation reads 4.5 KC (13.5 KC wide band) on plus (+) or minus (-) deviation, whichever is greater. This adjustment should be made with the correct level of tone applied on Channel Guard transmitters.

NOTES:

--MASTR transmitters are adjusted for 4.5 KC (13.5 KC wide band) deviation at the factory. The factory adjustment will prevent the transmitter from deviating more than 5.0 KC (15 KC wide band) under the worst conditions of frequency, voltage and temperature.

If the deviation reading plus (+) and minus (-) differs by more than 0.5 KC (1.5 KC wide band), check the following:

1. Recheck Step 1 as shown in the Transmitter Alignment Chart.
2. Check Audio Sensitivity by reducing generator output until deviation falls to 3.3 KC (10 KC wide band). Voltage should be LESS than 90 millivolts.

1. -20 volt DC supply at J102-12-16.						
2. Measure 12.6 VDC across Q3 emitter resistor R31, then:						
(a) Remove crystal - a slight variation in R31 voltage reading indicates Q3 stage operating properly.						
(b) If no voltage is measured, check keying leads, CR3-CR6, Q3.						
(c) With crystal removed, short Q4 base to emitter. A voltage reading above 1.0 volt indicates Q4 and Q5 are operating properly. Defect may be in Modulator.

PRODUCTION CHANGES

Changes in the equipment to improve performance or to simplify circuits are identified by a "Revision Letter" which is stamped after the model number of the unit. The revision stamped on the unit includes all previous revisions. Refer to the Parts List for descriptions of parts affected by these revisions.

REV. A - (Models 4ET56A16-21 only)
To reduce Channel Guard distortion, changed CR1, CR2, CR3 and R4 and added C14.

REV. A - (Models 4ET56A10-15 only)
REV. B - (Models 4ET56A16-21 only)
To improve stability of 2nd Multiplier, changed T1.

Elementary Diagram Changes:

Was

Changed To

REV. C - (Models 4ET56A16-21 only)
To reduce Channel Guard distortion. Changed R20 on Exciter Board Assembly.

REV. B - (Models 4ET56A10-15 only)

REV. D - (Models 4ET56A16-21 only)
To increase PA grid drive. Replaced R6 with R16 on PA Board Assembly.

REV. C - (Models 4ET56A10-15 only)

REV. E - (Models 4ET56A16-21 only)
To increase sensitivity of microphone input. Changed C2 and R3 on Exciter Board Assembly.

REV. D - (Models 4ET56A10-15 only)

REV. F - (Models 4ET56A16-21 only)
To incorporate improved semiconductor components into the Exciter Board Assembly. Changed C3, CR3-CR6, CV1 and CV2, Q6, R14 and R20; deleted T1; and added CV3-CV6, R12 and T2.

REV. G - (Models 4ET56A16-21 only)
To protect Channel Guard Encoder from RF fields. Added C16 and replaced CR3 with CR4 on Encoder Assembly (G101).

REV. H - (Models 4ET56A16-21 only)
To reduce tone distortion. Changed R3 on G101.

REV. A - (Models 4ET56B10-15 only)
To increase range of modulation control. Changed R51 and R52 on Exciter Board Assembly.

ORDERING SERVICE PARTS

Each component appearing on the schematic diagram is identified by a symbol number, to simplify locating it in the parts list. Each component is listed by symbol number, followed by its description and G-E Part No.

Service parts may be obtained from Authorized G-E Communication Equipment Service Stations or through any G-E Radio Communication Equipment Sales Office. When ordering a part, be sure to give:

1. G-E Part Number for component
2. Description of part
3. Model number of equipment
4. Revision letter stamped on unit

These instructions do not purport to cover all details or variations in equipment nor to provide for every possible contingency to be met in connection with installation, operation or maintenance.

Should further information be desired, or should particular problems arise which are not covered sufficiently for the purchaser's purposes, contact the nearest Radio Communication Equipment Sales Office of the General Electric Company.
