## DESCRIPTION

The System Control Logic/IF circuit board combines functions of receive circuit 1st IF, 2nd IF, audio detection, audio signal processing and system control on one circuit board. As an option, an additional circuit board can be plugged into this board to provide **AEGIS™** (digital encryption system). Programming and personality information is stored in **FLASH** and **EPPROM** memory on the logic/IF board. The audio speaker amplifier is also part of the same board.

Electrical interfaces are achieved between this board and the Control Unit (LCC), synthesizer, RF PA (APC) and the Option and Remote Control Connector (**ORCC**) on the rear of the assembled radio.

All radio control signals originate or terminate on the control logic/IF board. Two microcomputers share the processing load. Control signals are connected through a high speed digital link with the control unit, either through the LCC or ORCC connectors, making possible either front or remote control for the radio. The same link also makes possible dual radio or dual control head configuration. An RS-232 compatible digital link is available at the ORCC interface, to facilitate programming or Radio Data Interface to Mobile Digital terminals.

This circuit board also generates Type 99, Channel Guard, GE-Star and DTMF signals if so programmed.

The System Control Logic/IF board consists of the following control logic, IF and audio circuits (see figures 1 & 2).

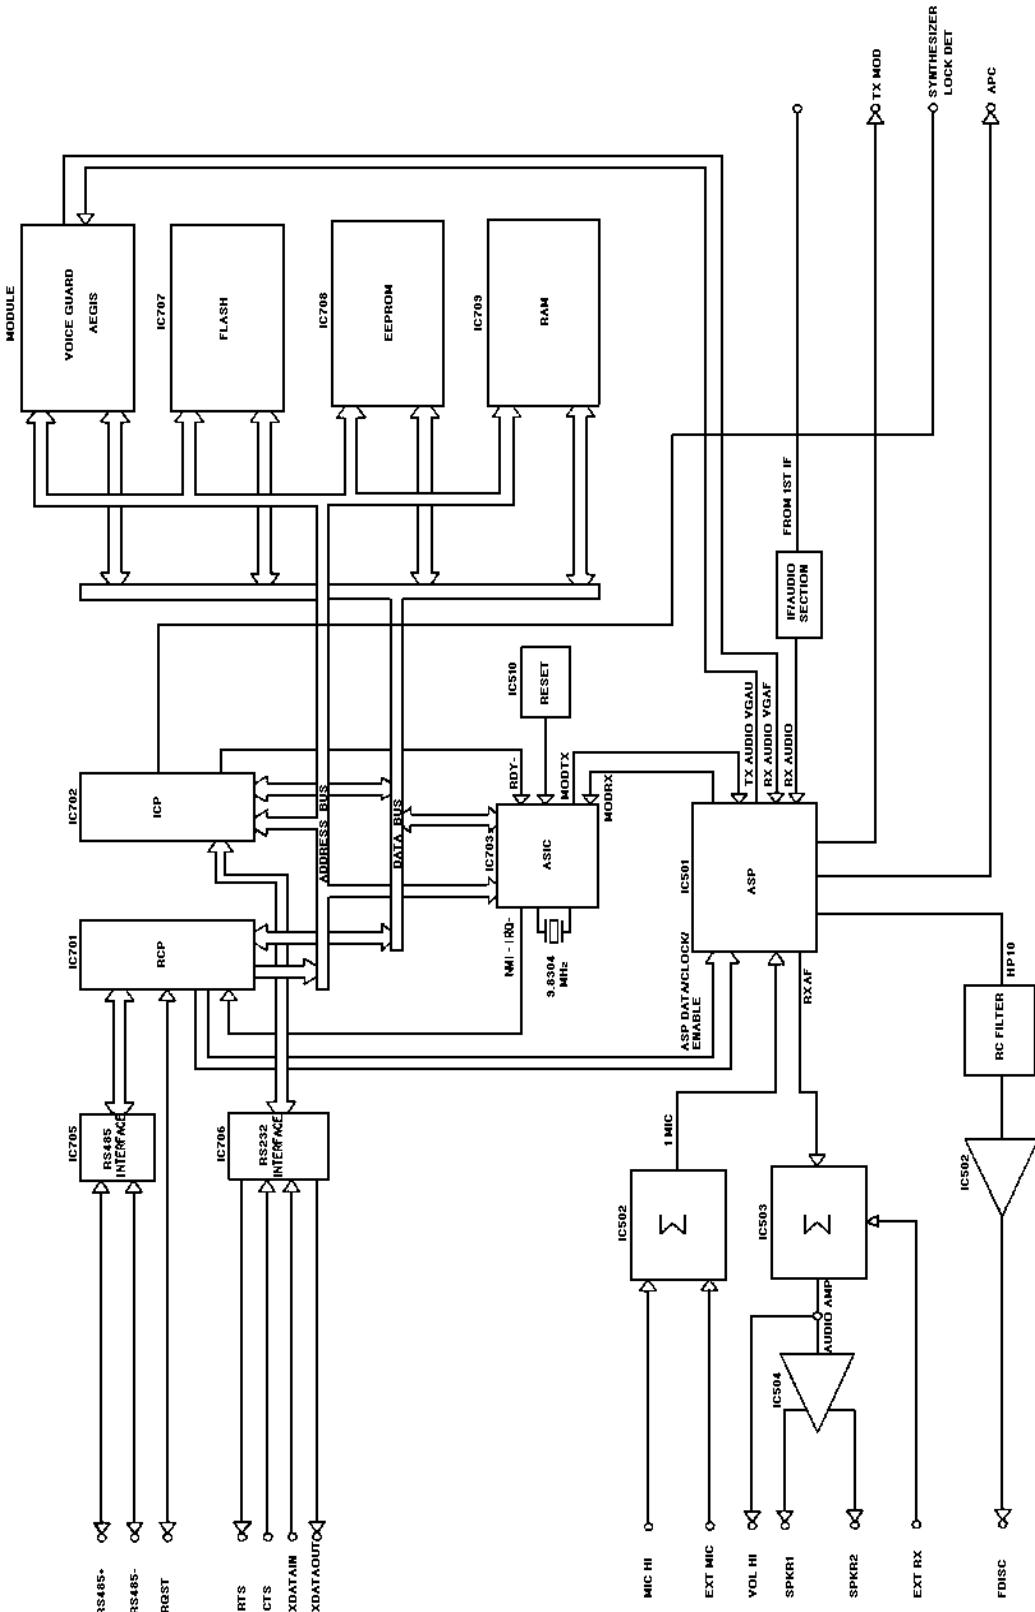

Figure 1 - Logic Section Block Diagram

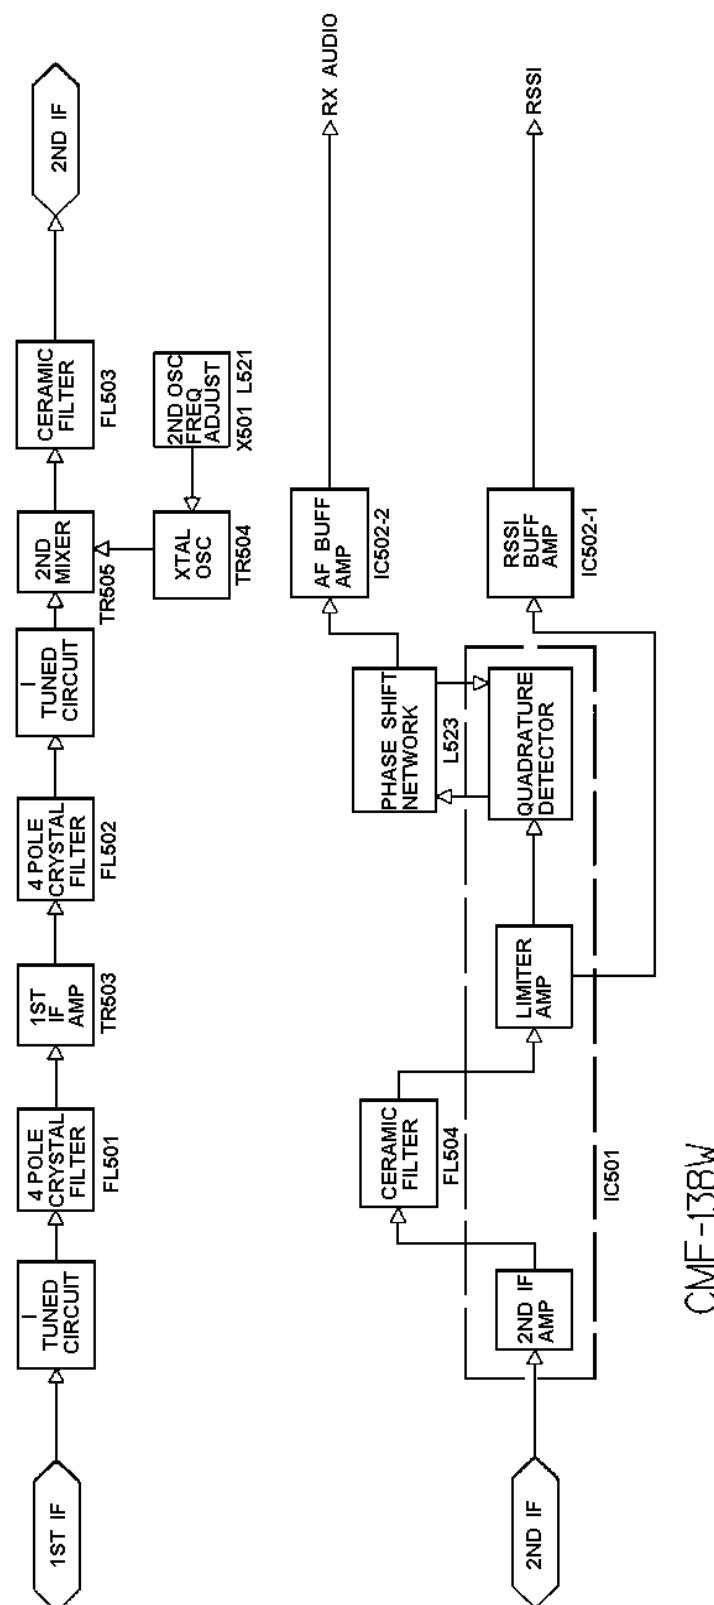

Figure 2 - IF Section Block Diagram

### EEPROM (IC708)

This EEPROM has a storage capacity of 8k x 8 bits. The memory contains the user configurable parameters that must be maintained through a power cycle. This personality controls various functions of the radio. The personality data is entered from outside the radio through the ORCC connector to the microprocessor and then to the EEPROM.

The data mainly consists of the following:

- Channel Frequency Data
- CG/DCG Data
- Tx Power, Tx MODulation Data
- Squelch Data
- Display Data, etc.

### APPLICATION OF SPECIFIC INTEGRATED CIRCUITS

#### ASIC (IC703)

The ASIC is basically a chip that integrates many miscellaneous functions. The chip provides functions as follows:

- MODEM

- Address Decode etc.

#### Voltage Regulators (IC606, IC607) (IC605, IC608, IC609)

Voltage regulators IC606 and IC607 each generate a 5 Vdc for the Control Board. Voltage regulators IC605, IC608 and IC609 each generate a 9 Vdc for the Control Board and Voice Guard Adapter Module.

#### Audio Amplifier (IC604)

The audio amplifier is located between the audio processor and the speaker. Amplifier IC604 amplifies the output signal of the ASP (IC601) to the level adequate for driving the speaker.

#### Audio Signal Processor (ASP) (IC601)

The audio process consists of a one-chip IC accommodating almost all of the audio functions. The audio functions are

under control of the microcomputer in compliance with the function of the radio unit.

The functions of the audio processor are as follows:

- Rx Audio process with Tone Reject Filter, De-emphasis and Programmable Attenuator.
- Data Limiting
- CG/DCG filtering and limiting
- Noise Squelch filtering and detecting
- 8 bits D/A Converter with sample and hold
- Tx audio process with microphone amplifier, pre-emphasis, deviation limiter, summing amplifier, post limiter filter and programmable attenuator
- Data signal filtering
- Two 6 bits programmable divider for clock and alert tone

All of these functions are made up of switched capacitor filters, amplifiers and timing logic. The timing for this logic is derived from the 4.9152 MHz clock generator (ASIC).

#### RS-485 (IC705)

This is a high speed differential TRI-STATE bus/line transceiver designed to meet the requirements of EIA standard RS-485 specification. The IC705 is located between the Radio Unit and the Control Unit.

#### RS-232 (IC706)

This IC consists of line drivers/receivers designed to meet the requirements of EIA standard RS-232 specifications. The IC706 is located between the radio unit and the ORCC.

#### Reset Circuit (IC610)

This is an active low reset IC which includes a delay time generating circuit. Delay time can be set up by externally using a capacitor and a resistor. The function of this IC is to accurately reset the system after detecting voltage at the time of switching power on and instantaneous power off.

#### Option and Remote Control Connector (ORCC)

The ORCC is located on the rear of the radio and is used for options and accessories when Control Unit and Radio Unit are directly attached and for remote control in all other configurations. The ORCC allows various kinds of external equipment connections to be made. External equipment connecting signals are as follows:

## IF SECTION (CMF-138)

### 1st IF

The 82.2 MHz 1st IF output signal is coupled from the output of the first mixer circuit, located on the Synthesizer/Receiver/IF board, through 30-pin connector P501-1 and capacitor C501 to the source input of buffer amplifier Junction Field Effect Transistors (JFET) TR501 and TR502. This input can be monitored at test point TP1. The output of TR501 and TR502 is coupled through inductor L502 to 4-pole crystal band-pass filter FL501. The highly-selective crystal filters FL501-1 and FL502-2 provide the first part of receiver IF selectivity. The output of the filters is coupled through the impedance matching network consisting of inductor L502 and capacitors C504 and C505 to the base of 1st IF amplifier transistor TR503.

The crystal filter output of FL501 is applied to the base of 1st IF amplifier transistor TR503. This amplified signal is taken from the collector of TR503 through an impedance matching network consisting inductor L505, capacitor C506 and resistor R507 that matches the amplifier output to the input of 4-pole crystal filters FL502-1 and FL502-2 which provides the second part of receiver IF selectivity. The output of the crystal filters is coupled through an impedance-matching network consisting of inductor L507, capacitor C508, resistor R508 and coupling capacitor C509 to the base of 2nd IF amplifier transistor TR505.

### 2nd Mixer

The 82.2 MHz IF input is applied to transistor TR505 and mixed with a 82.655 MHz frequency supplied by a crystal oscillator circuit consisting of X501 and oscillator transistor TR504. Variable inductor L521 sets the frequency of the oscillator circuit. This signal can be monitored at test point TP5.

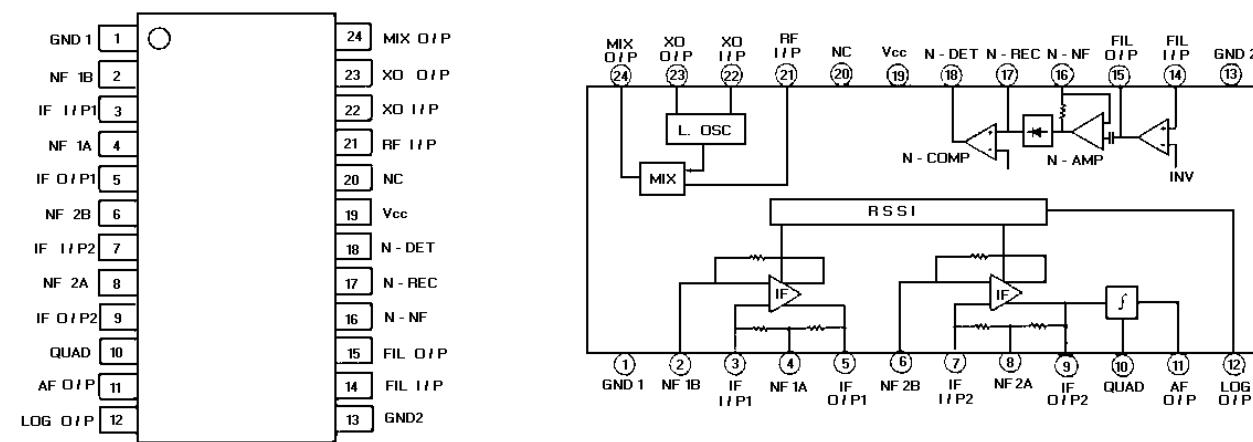

### 2nd IF And Detector

The output of the 2nd mixer is coupled to the input of 4-pole ceramic filter FL503 which provides 455 kHz 2nd IF selectivity. The 455 kHz IF output of ceramic filter FL503 is coupled to Pin 3 of Limiter/FM Detector IC501. The IF signal is amplified internal to IC501 then applied to 4-pole ceramic filter FL504 which provides additional 455 kHz IF selectivity (Refer to IC DATA for IC501). The output of the 455 kHz filter is applied to IC501, Pin 7. The 2nd IF signal is amplified and limited internal to IC501. Inductor L523 shifts the IF signal by 90° and applies it to the internal FM detector. The FM detector compares the shifted IF signal to the internal IF signal to recover the audio modulation. The audio output of the operational amplifier internal to IC501 is applied the input of buffer amplifier IC502-2. The AUDIO output of IC502-2 is applied to the System Control Logic circuit. This signal can be monitored at test point TP4. The output on Pin 12 of IC501 is applied to the input of amplifier buffer IC502-1. The output of IC502-1 provides a Receiver Signal Strength Indicator (RSSI) signal also sent to the System Control Logic circuit. This signal can be monitored at test point TP3.

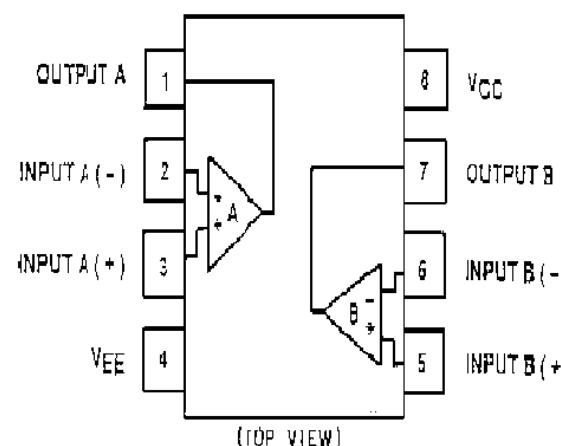

### 9 Volt Regulator

The 9-volt regulator circuit powers the IF circuits of CMF-138 and consists of regulator IC503 and filter capacitors C570, C571 C572 and C573. An input voltage of +13.8 Vdc is applied to the input of IC503. This input is monitored at test point TP2.

**PRODUCTION CHANGES**

Changes in the equipment to improve performance or to simplify circuits are identified by a "Revision Letter", which is stamped after the model number on the unit. The revision stamped on the unit includes all previous revisions. Refer to the Parts List for the description of parts affected by these revisions.

**REV. A - UHF TX RX 344A4578P1, P2 & P3  
Control Logic Board CMC-862**

To eliminate "sneak" current path on switched outputs. Deleted diodes CD713 and CD714.

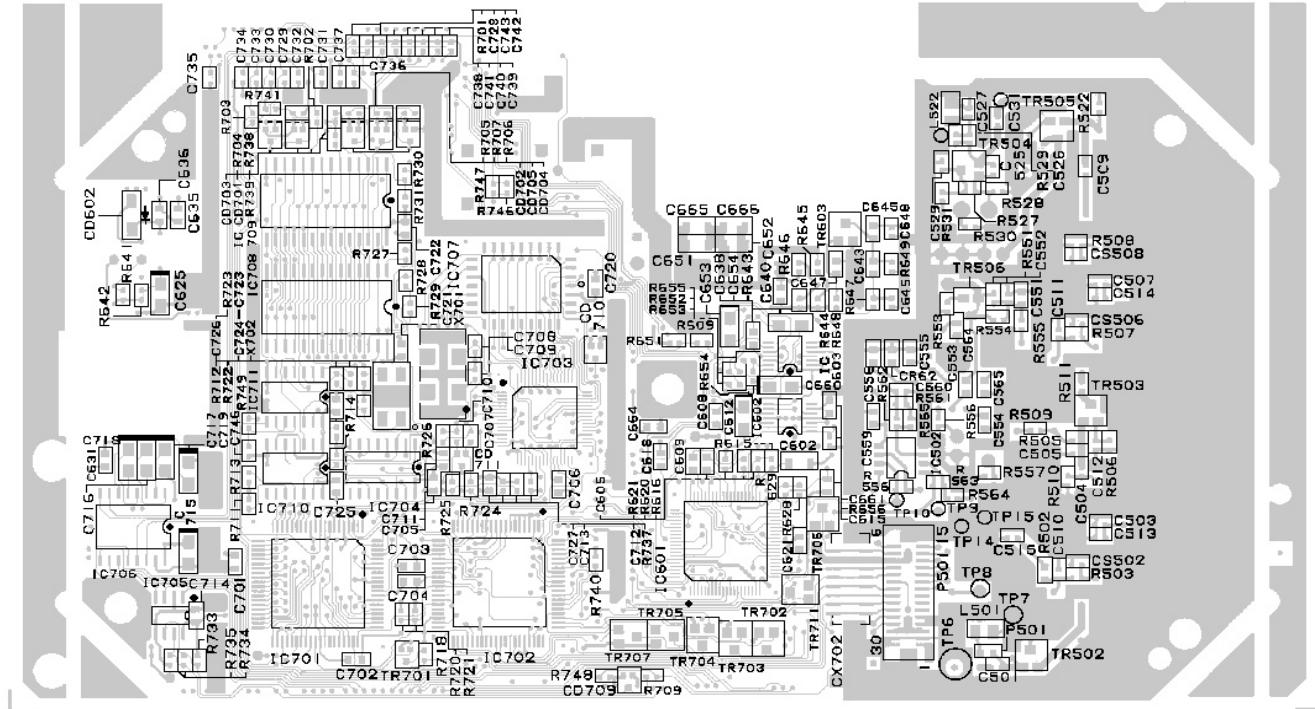

**REV. B - UHF TX RX 344A4578P1, P2 & P3  
Control Logic Board CMC-862**

To reduce TX hum and noise. Added 2.2k ohms resistor between capacitor C670 and capacitor C603.

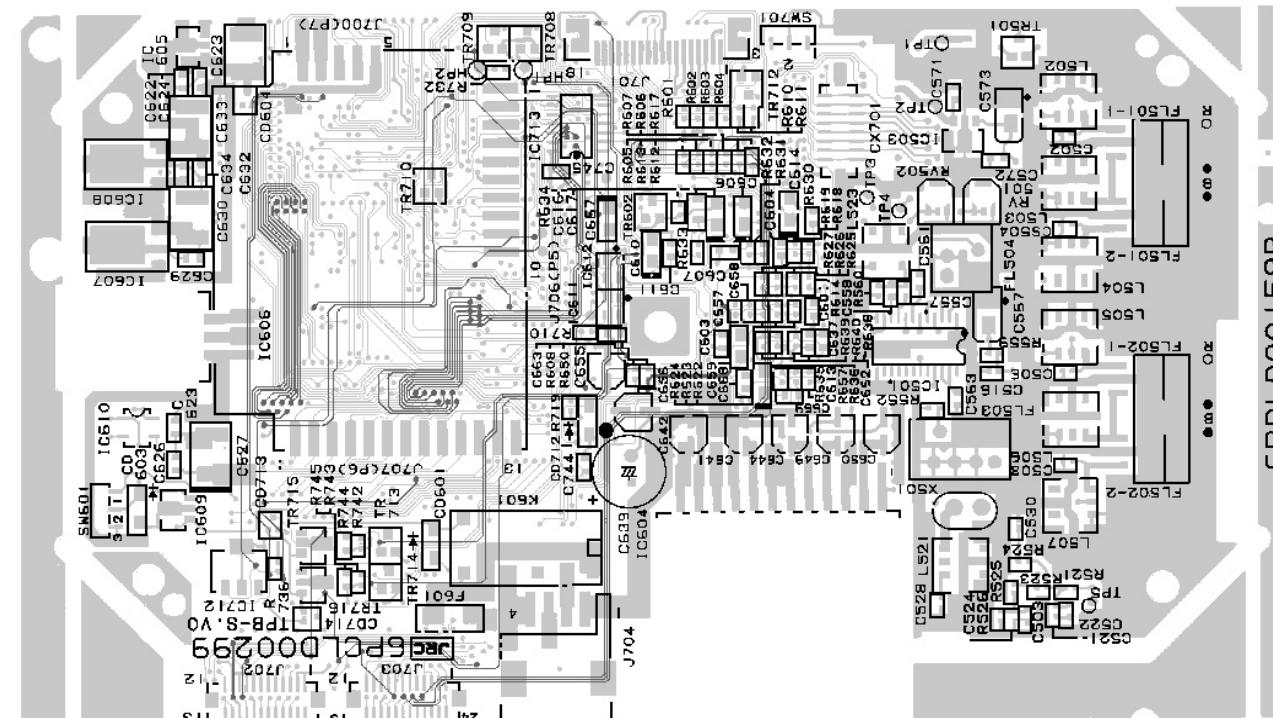

**REV. C - UHF TX RX 344A4578P1, P2 & P3**

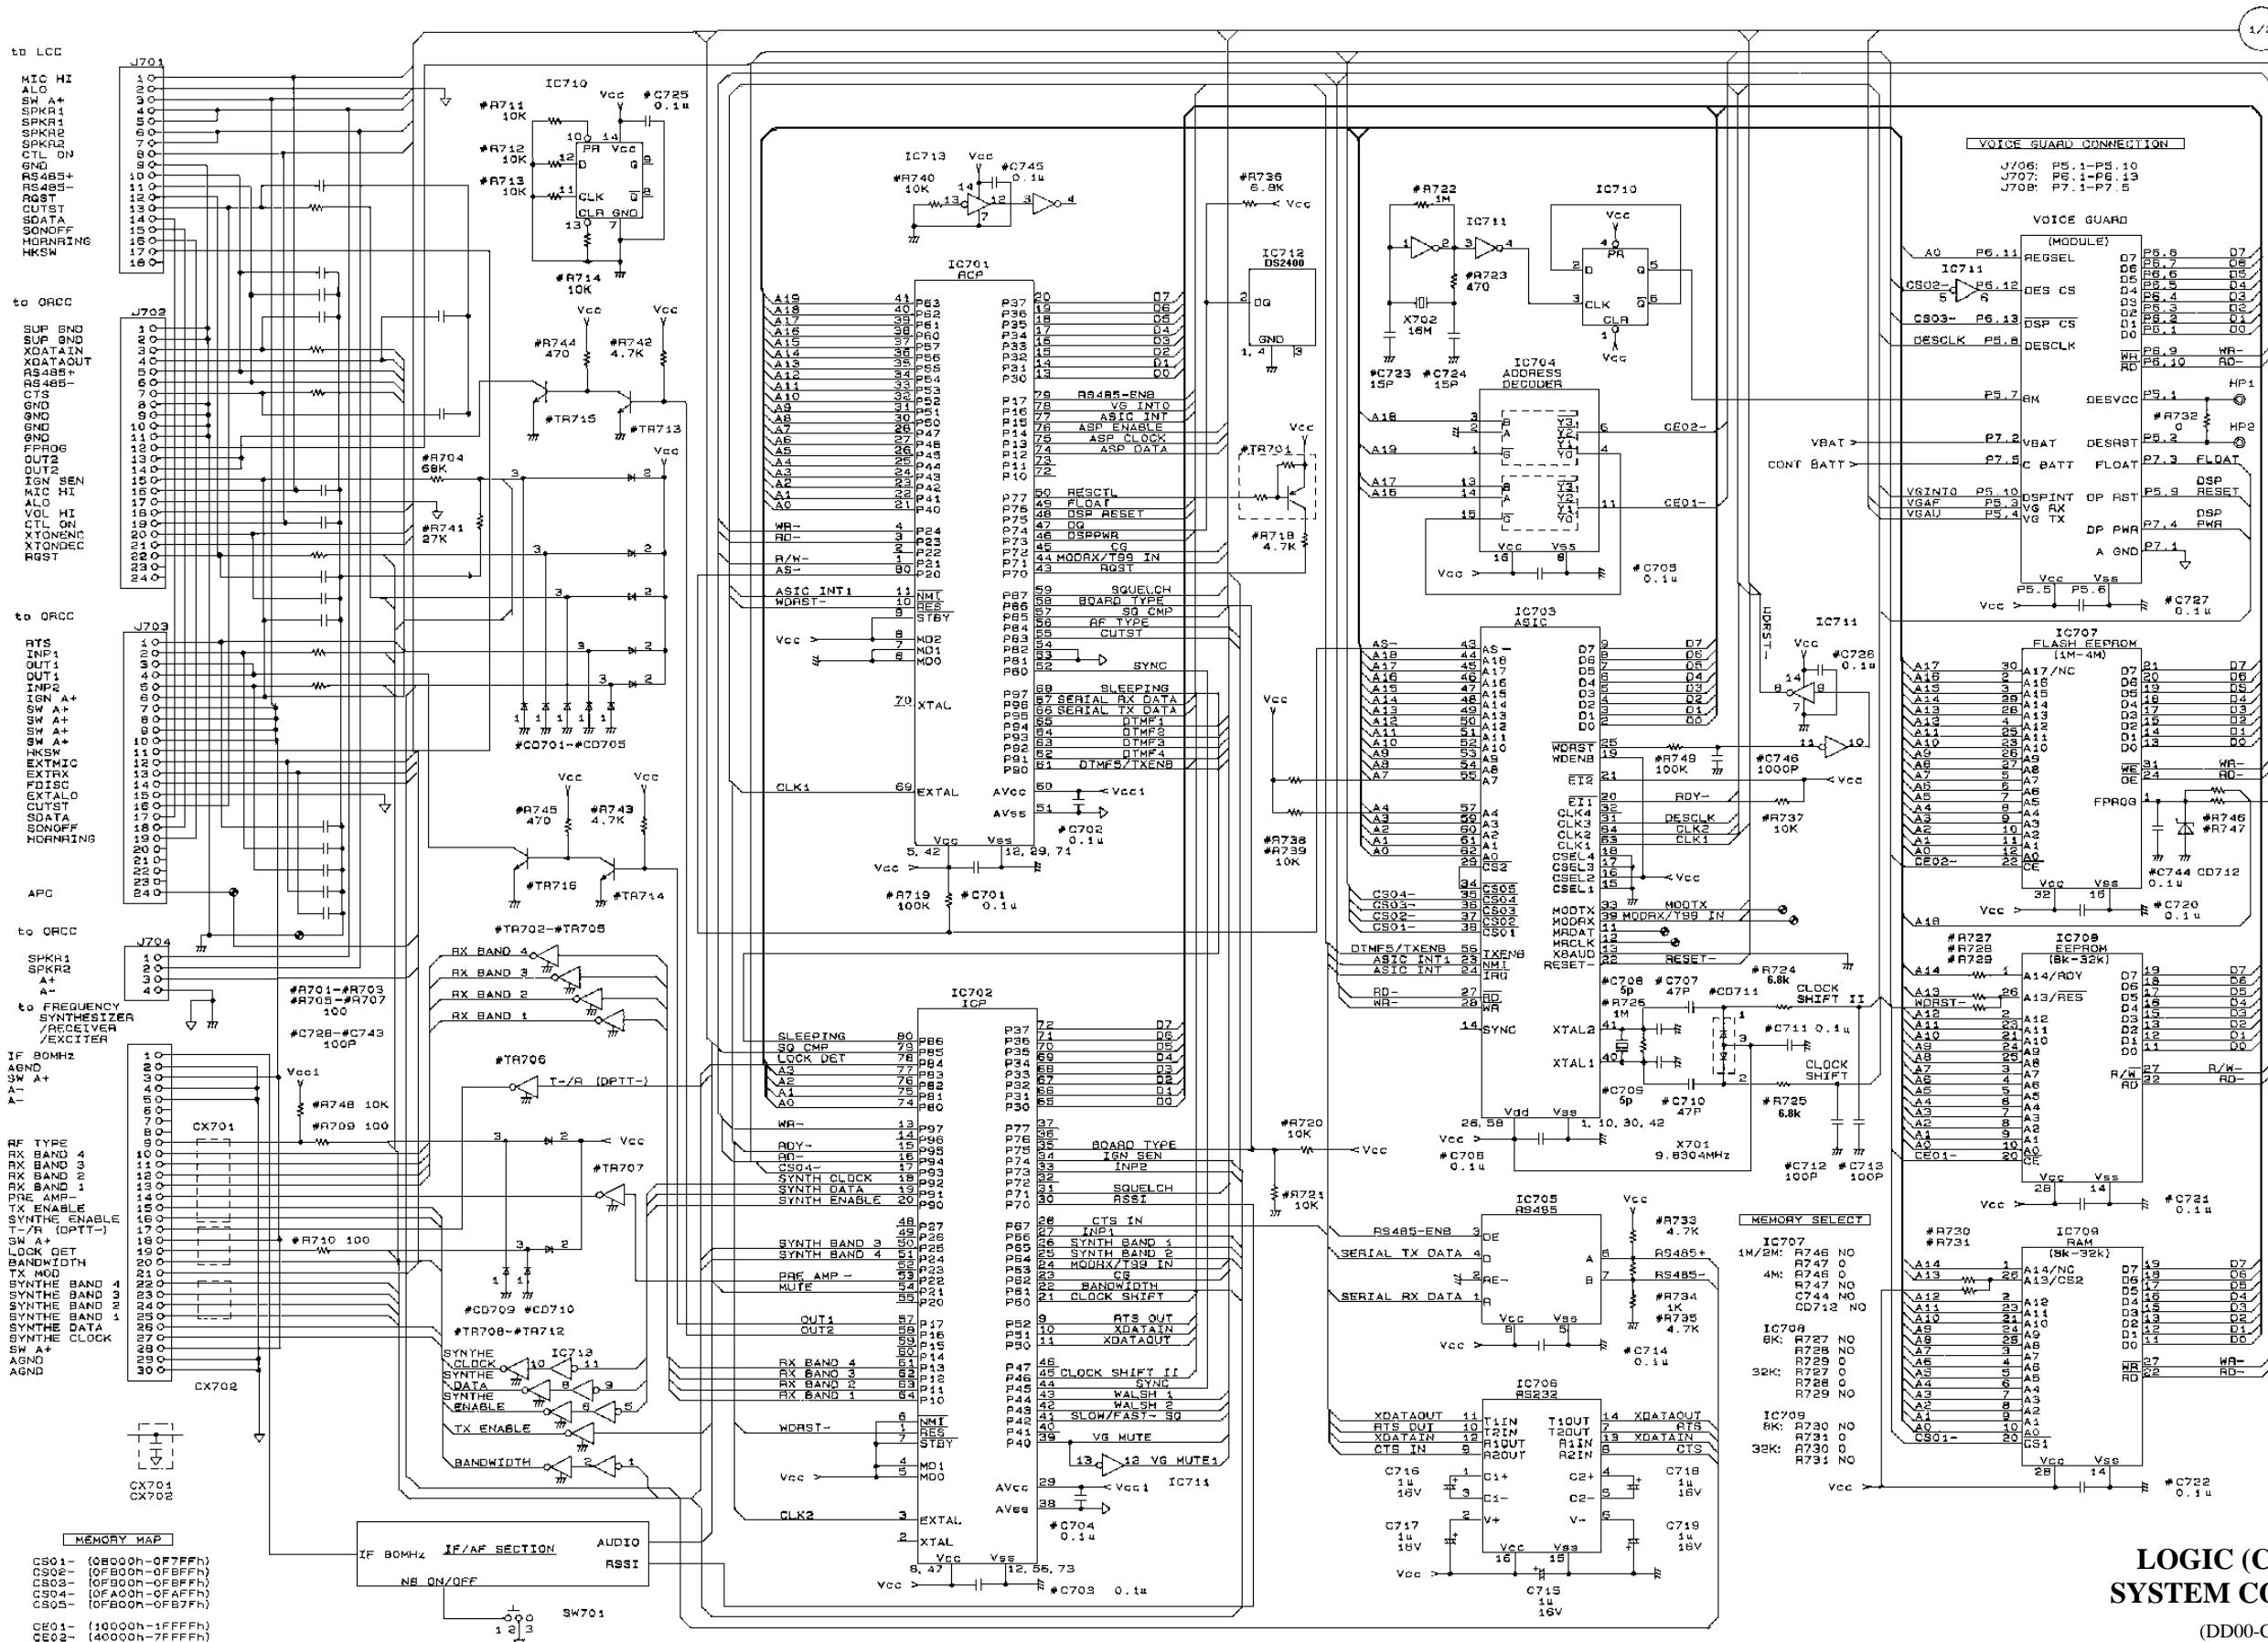

To improve Dual Radio speaker gain balance and improve RF Type decoding. Removed CD606 and R651, R636 was 10k ohms, R609 was 22k ohms, added R664 and CD606 and connected R748 to Vcc1.
