DESCRIPTION

The RF Board for the MDX mobile radio consists of the following circuits:

- A frequency synthesizer for generating the transmit carrier frequency and the receive circuit first mixer injection frequency.
- The transmit exciter, PA and power control circuits.
- The receive circuit front end, IF and FM detector.
- Voltage Regulators.

The RF Board is mounted in the bottom of the frame assembly. Refer to Combination Manual LBI-39015 for a mechanical layout of the radio. Figure 1 of this publication provides a block diagram of the transmit and receive circuits. Figure 2 provides a block diagram of the synthesizer.

Transmit circuit adjustments for frequency, power and deviation are accessible from the topside of the board, as are IF alignment, second oscillator and audio level adjustments for the receive circuit. Chip components on the bottom of the board provide optimum RF performance, while being accessible for easy servicing by removing the "friction fit" bottom shields.

Selected use of sealed modules permit small board size as well as RF and mechanical protection for sensitive circuitry. Modules are not repairable and must be replaced if they are determined to be damaged.

CIRCUIT ANALYSIS

SYNTHESIZER CIRCUIT

The synthesizer generates all transmit and receive RF frequencies. The circuit uses a phase-locked Voltage Controlled Oscillator (VCO) operating on the actual transmitter frequency (136-153 MHz or 150-174 MHz) during transmit and 45 MHz above the actual receiver frequency during receive. The synthesizer output signal is generated directly by VCO module U201 and buffered by transistor Q201 to a level of +8 dBm. This signal feeds the receiver mixer and is attenuated to 0 dBm by resistor R201 to feed the transmitter exciter module.

The synthesizer frequency is controlled by the microprocessor on the Audio/Logic Board. Frequency stability is maintained by a Temperature Controlled (X)crystal Oscillator (TCXO) module. The oscillator is high stability 2.5 PPM (0.00025%) over the temperature range of -30° C to $+60^{\circ}$ C and determines the overall frequency stability of the radio.

The VCO output is also buffered by transistors Q203 and Q204 to feed divide by 128/129 dual modulus prescaler U205. The prescaler feeds the **F**_{IN} input of Phase-Lock-Loop (PLL) U206. Within U206, the prescaled signal is further divided down to 5 kHz or 6.25 kHz to be compared with a reference signal. This reference signal is derived from the 12.8 MHz down to the 5 kHz or 6.25 kHz reference frequency.

Divider circuits in U206 are programmed by three inputs from the Audio/Logic Board which are buffered and inverted by transistors O208, O209 and O210. The S ENABLE pulse activates switch U202 to allow more rapid channel acquisition during channel changes.

A LOCK DET signal from the PLL goes to the microprocessor for processing to prevent transmission when the VCO is not on frequency and to provide an error message to the user. During receive, an unlocked synthesizer is indicated by SYN **LOCK** in the display. The microprocessor will continually try to reload the frequency information into the PLL until the synthesizer locks. During transmit, only a slower pulsed alert tone will be heard. Once unlocked in transmit, the synthesizer will not be reloaded. The transmitter PTT must be unkeyed and then rekeyed to attempt to relock.

Audio modulation from the Audio/Logic Board is applied to the VCO module through DEVIATION ADJUST potentiometer R226. VCO TUNE potentiometer R218 adjusts the operational frequency range of the VCO by varying a negative bias from diodes D202 and D203. Low frequency modulation is applied to the TCXO through LOW FREQ. ADJUST potentiometer R250.

TRANSMIT CIRCUIT

The transmit circuit consist of a fixed-tuned exciter module, a 10 Watt PA module, a PIN diode switch, a low pass filter, a directional coupler, a power control circuit and a transmit voltage switch.

Exciter Module

The Signal Flow Diagram shows the synthesizer driving the receiver mixer at +8 dBm and is attenuated by resistor R201 to 0 dBm for driving the exciter input. Exciter module A102 operates from a switched voltage supply. The exciter module bandwidth is sufficiently wide that both the 136-153 MHz and 150-174 MHz bands are allowed. No tuning is required. Both input and output ports operate at 50 ohms impedance. The exciter module provides typically 23 dB of gain and 200 mW of output power to drive the power amplifier module.

Power Amplifier Module

PA module U101 requires a drive of 200 mW from the exciter module to deliver up to 10 Watts power output. The module is mounted to the rear heat sink. The PA module output drives the 40-Watt PA board through connector J103. The power control circuit controls the PA module output power.

PIN Diode Switch, Low Pass Filter and **Directional Coupler**

The output from the 40-Watt PA Board feeds transmit PIN diode switch D104 through connector J102. When transmitting, switched 8 volts is applied through inductor L102, turning on **PIN** diodes D104 and D401. The DC path is completed through resistors R401 and R402 with the bias current set at about 40 mA. Diode D104 couples the PA Board power from J102 to low pass filter A101. Diode D401 provides an RF path to ground to protect the receiver input.

The low pass filter reduces the harmonic output from the transmit circuit and feeds directional coupler W101 and W102. The directional coupler provides a sample of transmit power for the power control circuit. The coupler output feeds antenna jack J101.

Power Control Circuit

The power control circuit samples the output power to the antenna to maintain a constant power level across the band. Also, a thermistor circuit senses the heat sink temperature to reduce the power level when the temperature is above 70°C. The power control circuit controls the supply voltage to one of the amplifier stages in PA module U101.

Directional coupler W101 and W102 provides a sample of transmit power for diode D101. Diode D101, resistor R106 and capacitor C104 produce a positive DC voltage proportional to the transmit circuit output power level. This DC level feeds the (-) input of amplifier U103-B. Power set potentiometer R111 and thermistor R118 determine the DC level to the (+) input of U103-B. Amplifier U103-B amplifies the difference between the (-) and (+) inputs, forcing the output power level to equal the power set level by varying the drive to transistors Q101 and Q102. Transistor Q101 supplies the control voltage to PA module U101. For example, if the output power level begins to drop below the power set level, the output of U103-B increases positively, causing Q102 to conduct less. The base of Q101 rises, increasing the control voltage to the PA module, which increases the output power level back to the desired set level.

Transistor Q104, capacitor C123 and resistor R105 improve the transient stability of the power control loop when the transmit circuit is keyed.

Transmit Switch

During transmit, the Audio/Logic Board microprocessor pulls the **DPTT** line low causing the output of amplifier U103-A to go loWatt. Transistor Q103 turns on to supply SW 8V to the exciter module, the power control circuit and the PIN diode switch. During receive, the output of U103-A supplies 12 volts to the receive circuit RF pre-amp Field Effect Transistor (FET) O401.

RECEIVE CIRCUIT

The dual conversion receive circuit consists of a front end section, a 45 MHz first IF and a 455 kHz second IF with an FM detector. All audio processing and squelch functions are accomplished on the Audio/Logic Board.

Front End Section

RF is coupled from antenna Jack J101 through the directional coupler and the low pass filter to PIN diode D401. When transmitting, SW 8V is applied through inductor L102, turning on PIN diodes D104 and D401, with the DC path completed through resistor R401. Diode D401 provides an RF path to ground for the receiver input while in transmit. In receive, D401 is off, allowing RF to pass by D401 unattenuated.

The RF pre-amplifier is a dual gate FET (3N201) with a 2-pole preselector filter and a 2-pole output filter. The input filter consists of inductors L402, L405 and associated capacitors. These components form a top coupled resonator filter. The input impedance level is 50 ohms while the output is loaded by the FET input impedance (approximately 1.89k ohms). Capacitor C408 is tuned for a flat bandpass response. The output matching circuitry is again a 2-pole filter. Resistor R408 provides a fixed loading impedance at the filter input. This inturn results in a 50 ohm impedance level at the loading port of filter Z402. Filter Z402 is a fixed tuned 3pole bandpass filter covering the full radio bandwidth. The mixer, Z403, is a doubly balanced diode mixer. This mixer is driven by a local oscillator signal of +7 dBm or greater to provide good inter-modulation performance, spurious performance and local oscillator isolation. The mixer conversion loss is typically about 6 dB.

First 45 MHz IF amplifier transistor O501 is a junction FET operated in the common gate mode. This configuration offers a typical input impedance of 75 ohms. The output circuitry is tuned by inductor L504 and loaded to provide the proper source termination for the 4-pole crystal filter which follows. The output of the crystal filter is matched by second IF

amplifier transistor Q502. This port is also tuned by inductor L506 and loaded to provide the proper filter termination. Transistor O502 is a dual gate FET operating at a bias current of about 10 milliamps. The output of Q502 is tuned by inductor L507 for maximum gain at 45 MHz and is loaded by the 2nd mixer in the U501 chip. This Q502 stage has a relatively high input and output impedance and needs high isolation within the active device. The dual gate FET provides the isolation required.

LBI-39019

45 MHz IF

Converter/IF/Detector U501

Pins 1 and 2 of U501 connect to an internally biased oscillator transistor. The external circuitry of this oscillator transistor includes crystal Y501 and forms and oscillator circuit operating at 45.455 MHz. The frequency of this third mode oscillator is adjusted by inductor L508. The oscillator drives the internal balanced mixer. The 45 MHz IF signal is translated to 455 kHz and appears at Pin 3 of U501. This IF signal is filtered by 6-pole ceramic filter Z503 and drives the internal 455 kHz amplifier and limiter. The limited 455 kHz in turn drives an internal quadrature detector. The phase shift network needed by the quadrature is provided by inductor L509. The audio output port is Pin 9 on U501. Inductor L509 is adjusted for maximum audio output level. The audio signal at Pin 9 is filtered by resistor R512 and capacitor C519 to reduce IF feed through. Buffer amplifier transistor Q503, drives audio potentiometer R513. This provides a VOL/SQ HI signal where the amplitude may be set for proper system operation using R513.

Power Distribution

Unswitched 13.8 Volts (A+) is supplied to the RF Board through connector J704 and feeds power control transistor Q101and PA module U101.

Switched 13.6 Volts (**SW A**+) is supplied to the RF Board through connectors J704 and J705 and feeds regulators U102, U207 and U502. Regulator U102 supplies 8 Volts to the transmit switch, synthesizer and 5-Volt regulator U203. Regulator U503 supplies the Audio/Logic board through connector J702. Regulator U207 supplies 8.5 Volts to the synthesizer. Regulator U507 supplies 8 Volts to the receive circuit.

SERVICE NOTES

TRANSMIT CIRCUIT

Most transmit circuit problems can be isolated by checking the TX power gains shown in Figure 1. The 40-Watt PA board may be bypassed by placing a jumper cable between connectors J103 and J102 on the RF Board. PA module U101 is capable of producing 10 Watts output.

Transmit Circuit DC Measurements

1. First ensure that Delayed **Push-To-Talk** (**DPTT**) is low when the microphone PTT is keyed loWatt.

- 2. Check for approximately 8 volts at L105 feeding the Exciter Module. If not present, troubleshoot the TX switch circuitry, Q103 and U103.
- 3. Check for approximately 7 volts across resistors R401 and R402. If not present, check PIN diodes D104 and D401 and the conduction path from R401 to the TX switch Q103.
- 4. Check for an adjustable voltage on Pin 2 of PA module U101. At maximum power, with Power Set Adjustment R111 fully clockwise, Pin 2 should be at 12 volts. If not present, check the power control circuitry: U103, Q101, Q102 and Q104.
- 5. Check for 13.6 volts on Pin 3 of PA module U101 and ensure a good mechanical and electrical ground from the PA module to the bracket and casting.

RECEIVE CIRCUIT

To isolate a receive circuit problem, refer to the following chart.

RECEIVE CIRCUIT SYMPTOMS AND CHECKS

SYMPTOMS	CHECKS
No Audio	1. U502 regulator
	2. The level and frequency of the first mixer injection frequency
	3. The level and frequency of the second mixer injection frequency
	4. Ouadrature detector circuit
	5. Quadrature detector coil tuning
Poor SINAD	 Consult Figure 1 - TX and RX Block Diagram for RX stage gains and troubleshoot
	2. Input cable
	3. PIN Diode switch is shorted
Distorted	1. Both mixer injection frequencies
Audio	2. Quadrature detector coil tuning
	3. Crystal filter source and load
	4. tuning
	Z503: 455 kHz ceramic filter

Figure 2 - Synthesizer Block Diagram

SYNTHESIZER

Synthesizer troubleshooting consists of first checking for the proper DC levels, then determining if the proper waveforms are present and checking individual modules.

DC Analysis

An 8.5 Vdc is supplied by regulator U207 and serves as the biasing voltage for transistor circuits Q203, Q204 and Q206 through Q210. Resistor R207 decouples the 8.3 volts for use in the VCO module U201. The 10 milliamp current drain of this module results in approximately 6.5 volts DC on Pin 4. Transistor Q201 also draws approximately 25 milliamps, resulting in a collector voltage of 3.5 volts DC at the junction of resistor R204 and capacitor C202. Lack of VCO RF output will modify this voltage.

Regulator U203 uses the 8 volts from transmit regulator U102 to generate 5 volts for U204 and U205.

<u>Waveforms</u>

Waveforms associated with the synthesizer were measured with a 10 megohm, 30 pF probe. Use DC coupling (see Figures 3-8).

Module Isolation

Reference Oscillator U204:

Look for a wave form similar to the reference on Pin 2 (see Figure 3). If wave form is not present the oscillator module is probably defective.

VCO U201:

Connect a DC power supply to Pin 3. With 2.5 volts DC on Pin 3, the output of U201, Pin 5, should be approximately 190 MHz for high split. With 6.5 volts DC on Pin 3, the output should be approximately 220 MHz. For low split the frequencies should be 181 and 198 MHz respectively.

Power output of the VCO can be measured by connecting a coax directly to the module, between Pin 5 and ground. The output should be approximately 0 dBm with C203 still connected in the circuit. In receive, a negative bias should exist on Pin 1. If not present, check transistor Q202 and capacitor C206 before removing the VCO.

Connect Pin 3 of the VCO to 4.5 volts DC. With the radio in receive, monitor the frequencies of the VCO at the connection of capacitor C201 and resistor R201. DC short Pin 1 of U205 to ground to cause divide 129. Tie Pin 1 to Pin 7 (5 volts) to cause divide by 128 to occur. Check Pin 3 to verify that this occurs. Improper division may indicate a defective prescaler.

Bilateral Switch U202: The bilateral switch is used to short around parts of the loop filter during channel scan. A shorted gate (to ground or adjacent gate) may be isolated by comparing voltages through the loop filter to those of a functioning radio . Defective gates might be suspected when the radio does not change frequency quickly enough.

Prescaler U205:

Phase-Lock-Filter U206:

There are no other specific checks which aid in evaluation of U206. Usually, it is suspected only if all other checks are OK. Before changing, inspect chip components for mechanical damage and check resistances through the loop filter.

Transistor Q201:

After checking for proper DC operation, measure the gain from the VCO, Pin 5 to R201/C202. The gain should be approximately 10 dB.

PA MODULE REPLACEMENT

To Install PA Module U101

- 1. Apply some silicone grease to the metal side of the replacement module.
- 2. Careful insert the four leads from the module into the four corresponding holes in the printed wire board. and slide the module into the shield. DO NOT solder the leads yet.
- 3. Slide the RF Board assembly back into the radio frame. Reinstall all hardware, harnesses, cables, etc. Replace all screws.
- 4. Install the two PA bracket screws before soldering the four module leads. Trim excess wire.

		INTEGRATED CIRCUITS		
U101	19A705326P2	PA Module - 136-153 MHz (Used in G1).		
U101	10A705326P1	PA Module - 150-174 MHz (Used in G2).		
U102	19A134717P3	Voltage Regulator; sim to A7808U.		
U103 and	19A701789P2	Linear: Dual Op Amp; sim to LM358.		
U104				
U105	RYT1246003/4	8-Volt Regulator; sim to LM35.		
U201	19D901958G1	VCO Board (Used in G1).		
U201	19D901958G2	VCO Board. (Used in G2).		
U202	19A700029P44	Digital: Bilateral Switch.		
U203 U204	19A704971P1 19B801351P26	Crystal Oscillator, temperature compensated: 12.80 MHz. 5 PPM.		
U205	19A704287P2	Prescaler: /128, /129; sim to MC12018.		
U206	19B800902P4	Digital: Synthesizer, CMOS Serial Input.		
U207	344A3820P1	Linear, Positive Voltage 8.5V Regulator .		
U501	19A704619P1	Linear: Osc/Mixer/IF/Det/Amp; sim to MC3361AP.		
U502	19A704073P2	Linear: 8 Volt Regulator; sim to MC78L08CP.		
U503	344A3820P1	Linear, Positive Voltage 8.5V Regulator .		
Y501	194705376P5	Crystal Fixed Frequency: 45 455 MHz 10 PPM		
		FILTER		
Z401	19A705327P1	Filter, VHF HB: 136-153 MHz. (Used in G1).		
Z401	19A705327P2	Filter, VHF HB: 150-174 MHz. (Used in G2).		
Z402 Z403	19A705327P2	Filler, LC, 150-174 MHZ. Balanced Mixer (Double): sim to Mini-Circuits SBL-1		
Z=03	19A705613G6	Monolithic Crystal: 45 000 MHz; sim to Toyocom 45E2B2		
Z502	PART OF Z501	Matched pair		
Z503	19B801021P2	Bandpass filter: 455 KHz 1.5; sim to Murata CFW-455E.		
5	19B801378G3	MISCELLANEOUS Heat Sink Assembly. Includes Q101, U102 and the follow- ing hardware:		
	19A705469P1	Insulator plate. (Used with Q101).		
	19A700068P1	Insulator bushing. (Used with Q101).		
	N402P5B6	Washer, Plain. (Qty. of 2 required).		
	N404P11B6	Washer, Loc K. (Qty. of 2 required).		
	N80P9005B6	Screw, Machine. (Qty. of 2 required).		
6	19B801490P1	Ground Strap. (Near Q104)		
(19A702364P106	wacnine screw: IORX Drive, No. M2 - 0.4 x 6.		

R117

19B800607P221

PART NUMBER	DESCRIPTION
19B801566P1 19B801566P2	SHIELD (Near L506). SHIELD (Near Q501).

PRODUCTION CHANGES

the equipment to improve or to simplify circuits are identified by a "Re-r", which is stamped after the model number of the unit. The revision the unit includes all previous revisions. Refer to the Parts List for departs affected by these revisions.

BOARD 19D904958G2

reduce synthesizer kick changed R235 (19B800607P183) to 39k ms. To reduce loading of TCXO, removed C254.

BOARD 19D904958G2

rrect failure rate of Q401, C421 was 180pF (19A702061P67).
