DESCRIPTION

The Receiver Front End (RXFE) Module amplifies and converts the RF signal to the first IF at 21.4 MHz. This is a down conversion process using low side (G9, G10) or high side (G6, G8, G11, G12) injection. The RXFE module is powered by a regulated 12 volts. The RXFE printed wiring board contains the following functional circuits:

- Preamplifier
- Image Rejection Filter
- Injection Amplifier
- Injection Filter
- Double Balanced Mixer
- Fault Detector

- Preselector Filter

All but the Fault Detector circuit in the RXFE module have 50 ohm impedance terminations.

Table 1 - General Specifications

ITEM	SPECIFICATION
FREQUENCY RANGE	380 - 400 MHz (G8) 403 - 430 MHz (G11) 470 - 492 MHz (G9) 492 - 512 MHz (G10) 403 - 425 MHz (G6) 370 - 390 MHz (G12)
IF FREQUENCY	21.4 MHz
3 dB BANDWIDTH	>3 MHz
IMPEDANCE	50 ohms at RF, LO, and IF Ports
CONVERSION LOSS	-1.5 ± 1.5dB
NOISE FIGURE (NF)	<7.5 dB
THIRD ORDER INTERCEPT POINT	>20 dBm (G9, G10) >16 dBm (G6, G8, G11, G12)
IMAGE REJECTION	>100dB
INJECTION POWER	-1.5 ± 1.5dB
TEMPERATURE RANGE	-30°C TO +60°C
SUPPLY VOLTAGE	12.0 Vdc
SUPPLY CURRENT	200 mA typical

CIRCUIT ANALYSIS

PRESELECTOR FILTER

The received RF signal (J2) is routed through the Preselector Filter (L1 through L5). This filter provides front end selectivity and attenuates the potential spurious signals of the first conversion. Typically, the filter has an insertion loss of 3 dB and an operational bandwidth of 2 MHz. The filter is a tunable, five-pole helical bandpass filter.

PREAMPLIFIER

The output from the Preselector is coupled through an impedance matching network consisting of C1, C2 and L6 to the base of Preamplifier Q1. The Preamplifier stage is supplied by the regulated +12 Vdc line (VCC1) and draws about 80 mA. It has a low noise figure and high Third Order Intercept point. Transistor Q2 provides Q1 with a constant current source. The bias on Q1 is monitored by the Fault Detector circuit via R17.

Capacitors C20 and C21 prevent any RF from entering the fault circuit. The preamplifier output signal is coupled to the Image Rejection Filter via an impedance matching network consisting of C4, C11, L8, L15, R5 and R6.

IMAGE REJECTION FILTER

Following the Preamplifier is the Image Rejection Filter. The Image Rejection Filter is a fixed tuned helical bandpass filter. The Filter has an insertion loss of about 2 dB.

INJECTION AMPLIFIER

The local oscillator input (J3) from the Receiver Synthesizer is coupled to monolithic amplifier U2, then to the base of Q8. The Injection Amplifier, consisting of U2, Q8, and associated circuitry, is capable of amplifying the injection signal to approximately 18 to 22 dBm. The amplifier is powered by the regulated +12 Vdc line (VCC1). Transistor Q7 provides Q8 with a constant current source. The bias on U2 and Q8 is

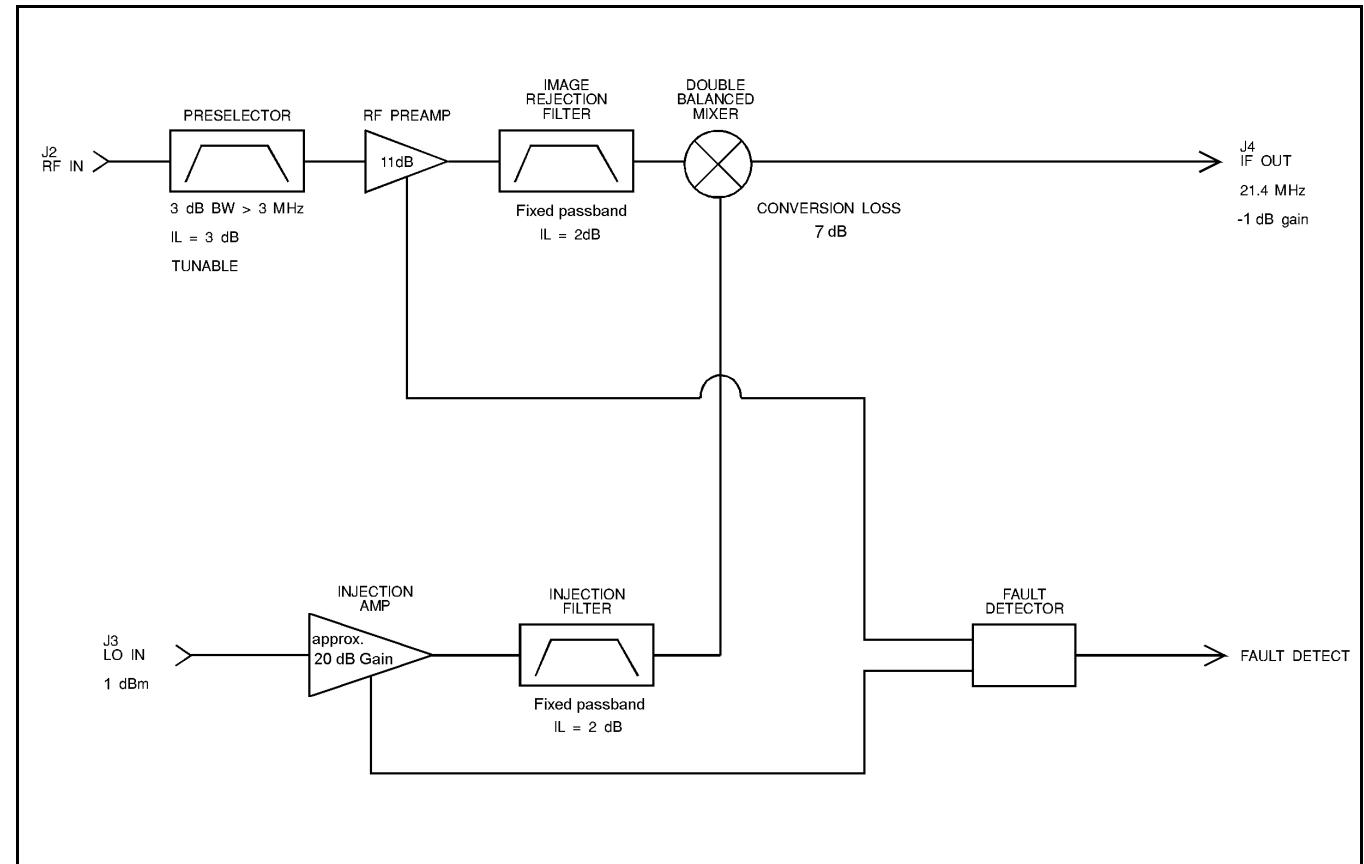

Figure 1 - Block Diagram

monitored by the Fault Detector circuit via R21 and R31, respectively. Capacitors C22, C23 and C26 prevent RF from entering the fault circuit. The Injection Amplifier output signal is coupled to the Injection Filter via an impedance matching network consisting of C8, L13, and resistors R15 and R16.

INJECTION FILTER

Following the Injection Amplifier is the Injection Filter. The injection filter is a fixed, tuned helical bandpass filter. It is used to attenuate harmonics of the Injection Amplifier. The filter has an insertion loss of about 2 dB.

DOUBLE BALANCE MIXER

The Double Balance Mixer (DBM) is a broadband mixer. It converts an RF signal to the 21.4 MHz first conversion IF frequency. The mixer uses low side (G9, G10) or high side (G6, G8, G11, G12) injection driven by a local oscillator signal. The mixer conversion loss is typically about 7 dB. The IF output signal is then routed through a diplexer circuit to the output connector (J4).

FAULT DETECTOR

The Fault Detector circuit monitors the operation of the preamplifier and injection amplifier devices. Operational amplifiers U1.1 and U1.2 compare the bias on the Preamplifier Q1 to preset levels, while U1.3 and U1.4 compare the bias levels on Injection Amplifiers U2 and Q8.

When the bias for Q1, U2, and Q8 is within the preset window limits, the output from the comparators is a logic high level. This high level signal is sent to the Station Controller on the FLAG 0 line.

If the biasing for the amplifiers is not within the proper operating range, the fault detector circuit will pull the FLAG 0 line low.

MAINTENANCE

TEST PROCEDURE

Following is a test procedure of the module to verify proper Conversion Gain :

- Supply 12 Vdc to pin 15A, B, C. (1C is ground.)
- Inject the desired RF Frequency into RF IN at a level of -10 dBm.
- Inject the desired local oscillator frequency into LO IN at a level of 0 dBm [LO frequency = RF frequency - 21.4 MHz (for groups G9, G10), or, LO frequency = RF frequency + 21.4 MHz (for groups G6, G8, G11, G12)].
- Measure the IF OUT power at 21.4 MHz, the ratio of RF IN to IF OUT should be -1.5 ± 1.5 dB.
- Measure the current drawn by the RXFE module. Typical current drain is 180 to 230 mA.

ALIGNMENT PROCEDURE

Alignment for the Receiver Front End module consists of tuning the five-pole Preselector Filter only. The Image Rejection Filter and LO injection filter are not to be tuned. Normally, the RXFE should only need the fine-tuning procedure. For a major receiver frequency change, the RXFE should be adjusted using the major-retuning procedure.

For Fine-Tuning

- Supply 12 Vdc to pin 15A, B, C. (1C is ground.)
- Inject the desired RF Frequency into RF IN (J2) at a level of -10 dBm.
- Inject the desired local oscillator frequency into LO IN (J3) at a level of 0 dBm [LO frequency = RF frequency - 21.4 MHz (for groups G9, G10), or, LO frequency = RF frequency + 21.4 MHz (for groups G6, G8, G11, G12)].
- Detect IF signal at 21.4 MHz. Slightly adjust L1 to L5 to get maximum power (don't adjust more than 1/4 turn). If an RF Voltmeter is used, connect a Low Pass Filter (LPF) to the IF OUT (J4) to attenuate high frequency components. The corner of the LPF should be set for 40 MHz.
- Repeat Test Procedure steps to verify conversion gain.

For Major Retuning

The best way to do a major retuning of the RXFE is with swept frequency tuning. The swept frequency tuning can be done using a Spectrum Analyzer and Tracking Generator. With proper Injection level the frequency response of the Preselector Filter can be seen by viewing the RF to IF port feedthrough on the spectrum analyzer. This feedthrough is typically 35 dB down from the input level at the RF port. Use the following procedure for swept frequency tuning:

- Supply 12 Vdc to pin 15A, B, C. (1C is ground.)
- Inject the Tracking generator output at 0 dBm into the RF IN connector, (J2).
- Inject local oscillator power at 0 dBm into the LO IN connector, (J3) [LO frequency = RF frequency - 21.4 MHz (for groups G9, G10), or, LO frequency = RF frequency + 21.4 MHz (for groups G6, G8, G11, G12)].
- Preset the height of slugs with respect to the top of five-pole cavity as follows (Table 2):
- Center the spectrum analyzer at the desired frequency and set the reference at about -30 dBm. Adjust L1 to L5 for best possible response.

TROUBLESHOOTING GUIDE

SYMPTOM	AREAS TO CHECK	READING (TYP.)
LOW CONVERSION GAIN	Check Vcc Preselector Loss Preamplifier Gain Image Rej. Filter Loss 1st Mixer Conversion Loss	12 V 3 dB 11 dB 2 dB 7 dB
FAULT INDICATOR LOW	Check Vc of Q1 Check Vc of U2 Check Vc of Q8	9 TO 10V 5 TO 6 V 9 TO 10 V
IF FREQUENCY OFF	Check L.O. FREQUENCY	L.O. frequency=RF frequency - 21.4 MHz (G9,G10) + 21.4 MHz (G6, G8, G11, G12)
LOW L.O. POWER*	Injection Amplifier Gain Injection Filter Loss	approx 20 dB Gain 2 dB

* NOTE: For troubleshooting the gain or loss, the RXFE needs to be under the normal operating condition:

- 12 Vdc supply.
- Inject L.O. power at a level of 0 dBm into LO IN (J3), [LO freq. = RF freq. - 21.4 MHz (G9, G10) or, LO frequency = RF frequency + 21.4 MHz (G6, G8, G11, G12)].
- Inject the desired RF signal at a level of -10 dBm into RF IN (J2).
- Terminate the IF OUT (J4) with a good 50 ohm impedance.
- Use a Spectrum Analyzer and 50 ohm probe (with good RF grounding) to probe at the input and output of each stage to check its gain or loss (see schematic diagram).
