## GENERAL

### INTRODUCTION

#### SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of the publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions. These are issued as required.

### ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts : components, kits, or chassis. If the part number is not known, include the chassis or kit number of which it is a part, and a sufficient description of the required component for proper identification.

### PERSONNEL SAFETY

The following precautions are recommended for personnel safety :

- DO NOT transmit until all RF connectors are verified secure and any open connectors are properly terminated.
- SHUT OFF and DO NOT operate this equipment near electrical blasting caps or in an explosive atmosphere.
- This equipment should be serviced by a qualified technician only.

### SERVICE

This radio is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained within.

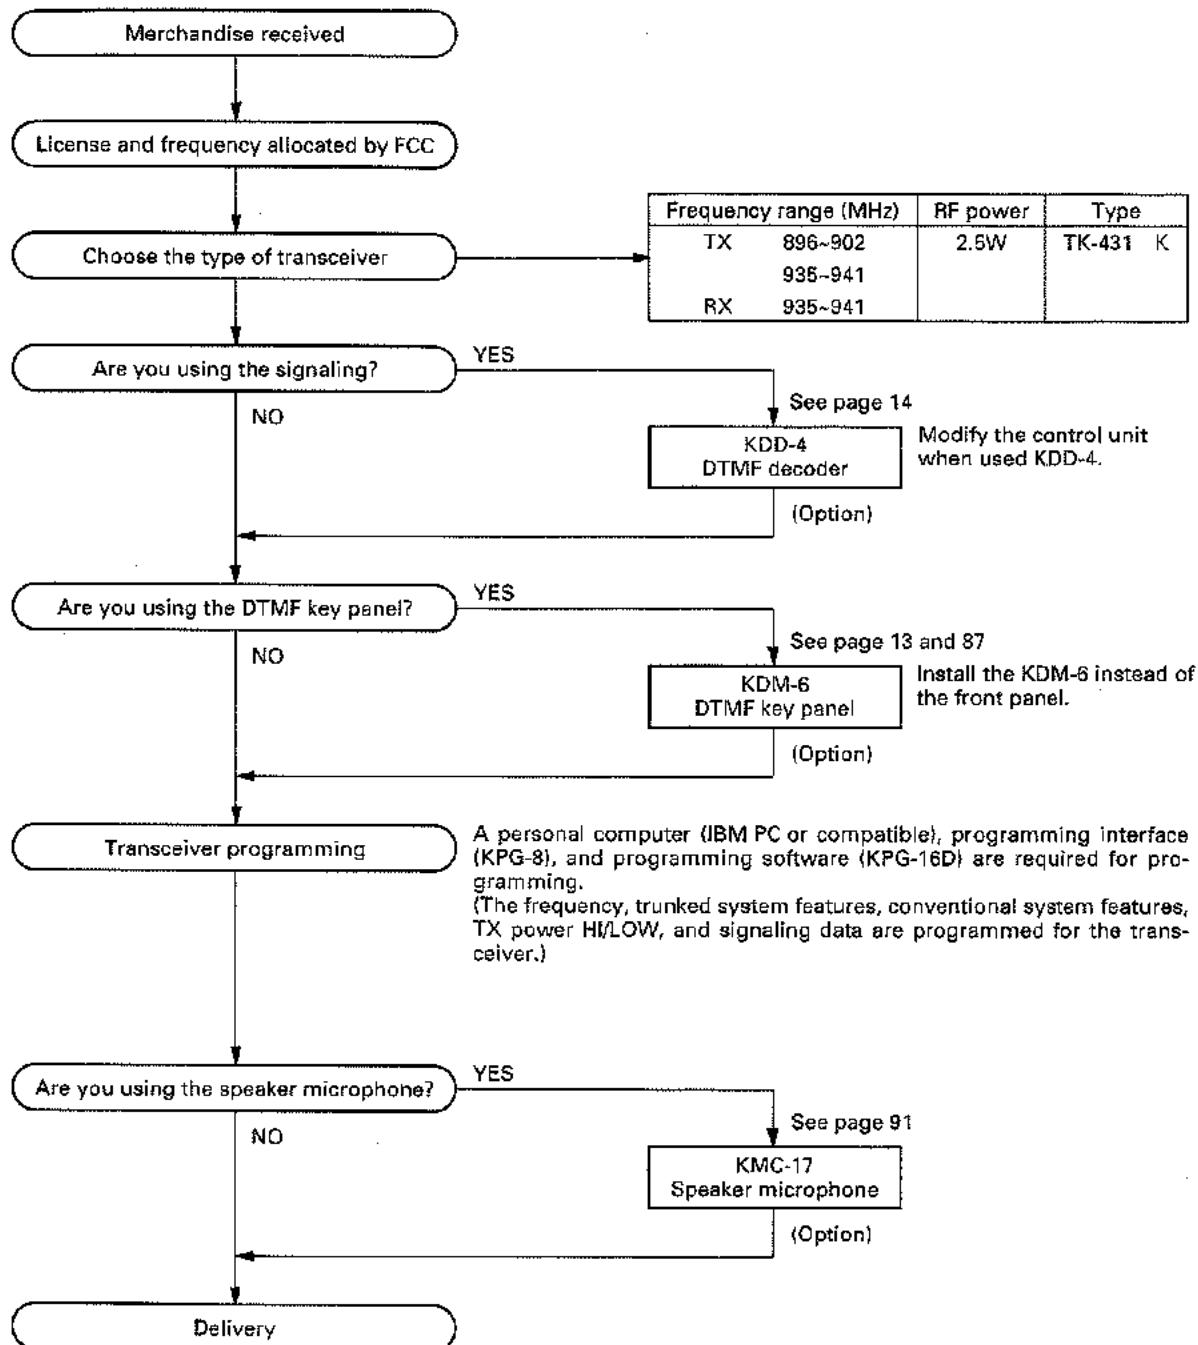

### NOTE

WE CANNOT guarantee oscillator stability when using channel element manufactured by other than KENWOOD or its authorized agents.

### FCC COMPLIANCE AND TYPE NUMBERS

Type acceptance number	Frequency range	Compliance
ALHTK-431-1	896~941MHz	Part 90

## SYSTEM SET-UP

## OPERATING FEATURES

**1. Operation Features**

The TK-431 is an 900-MHz-band EFJ LTR™-compatible trunked radio designed to operate in both trunked and conventional modes. The programmable features are summarized.

**1-1. General Transceiver Features**

- Any combination of sixteen trunked and conventional systems programmable.
- Up to ten groups are programmable in each system.
- Four-digit alphanumeric characters are programmable for each group.
- System scan is selectable with front-panel "S" key.
- System lockout during scanning
- Time-out timer
- CALL indicator
- Time-out timer
- Clear-to-talk
- External DTMF decoder (The optional KDD-4 DTMF decoder is required.)
- Test mode

**1-2. Trunked System Features**

The following features are available with systems programmed for trunked transceiver operation.

- Group Scan
- Transmit Inhibit
- Telephone Interconnect (The optional KDM-6 DTMF key panel is required.)
- Free System Ringback (This feature is available only when a telephone interconnect ID code is selected.)
- AUTO TEL (This feature is available only when a telephone interconnect ID code is selected.)
- Transpond
- Talk-around (Can be set for each group.)
- System Search

**1-3. Conventional System Features**

The following features are available with systems programmed for conventional transceiver operation.

- Up to ten channels are programmable in each system. (Channels are selected using the GROUP key.)
- Carrier squelch and QT/DQT operation
- Transmit Disable (Receive-only channel)
- Talk-around (Can be set for each group.)
- Busy Channel Lockout

**2. Transceiver Controls and Indicators (Fig. 1)****2-1. Top Panel Controls**

All the keys on the top panel are momentary-type push buttons. The functions of these keys are explained below.

**• POWER key**

Transceiver POWER key. When the power is switched off, all the parameters, such as the system and group, are stored in memory. When the power is switched on again, the system returns to the previous conditions.

**• LAMP key**

This key illuminates the LCD on the top panel. When the key is pressed, the LED lamp goes on. When it is released, the lamp goes off after about five seconds. If any key, except the power key, is pressed while the LED lamp is on, the lamp is kept on for five seconds. It is also kept on for five seconds by pressing a key on the optional KDM-6. This key also functions as the KDM-6 (DTMF key panel) backlight on/off key.

**• SYSTEM key**

When the SYSTEM key is pressed, the system number to be selected is incremented by one. When the key is held down, the system number changes continuously. After the system number reaches the highest system number, it goes back to the lowest system number. System numbers not set are skipped.

**• GROUP key**

This key is operated in the same way as the SYSTEM key. When the system number is changed, the GROUP indicator shows the original group number (the last selected group number in each system). The group to be set may differ by system.

**• S (Scan) key**

Each time this key is pressed, the system scan function is toggled on and off. The function of this key can be disabled by programming.

**• A (Auxiliary) key**

This key toggles the auxiliary function on and off. If this key is pressed once, the auxiliary function is enabled. If the key is pressed again, the auxiliary function is disabled. The confirmation tone is the same as that of the scan key. The following auxiliary functions are available and can be programmed by the FPU:

- 1) System scan delete function
- 2) Fixed revert system call (invalid if the system is not set)

# OPERATING FEATURES

- 3) Switching between alphanumeric display and system/group indicator (toggle)  
(Invalid if the alphanumeric display is not set)  
When the alphanumeric display is selected, the 1460-Hz confirmation tone is output for about 50ms. When the system/group indicator is selected, the confirmation tone is output twice (output 50ms, off 50ms, output 50ms).
- 4) RIC search function
- 5) TX power high/low switching function (toggle)
- 6) Invalid

## 2-2. Top Panel Displays and Indicators

### • System display

Indicates the selected system number (1~16). Only the programmed systems are displayed. The system display is located above the SYSTEM key.

### • Group display

Shows the selected group number (0~9). Zero indicates group 10. Only the programmed groups are displayed. The group display is located above the GROUP key.

### • Scan indicator

The **S** mark on the left of the system display goes on in system scan mode.

### • Delete (**►**) indicator

When a system locked out of the system scan sequence is selected, the **►** mark on the left of the system display goes on. It flashes when there is any locked system during system scan.

### • BUSY indicator

The BUSY indicator goes on if the PTT button is pressed when the trunked system is busy or while a TX inhibit ID is being received.

### • CALL indicator

The CALL indicator can be programmed so that it goes on when a specified call is received. This indicator goes off when any top panel key other than the LAMP key is pressed.

If the KDD-4 is installed and the call flag is Y, this indicator does not go on unless the DTMF code matches.

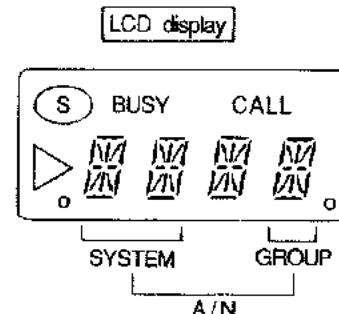

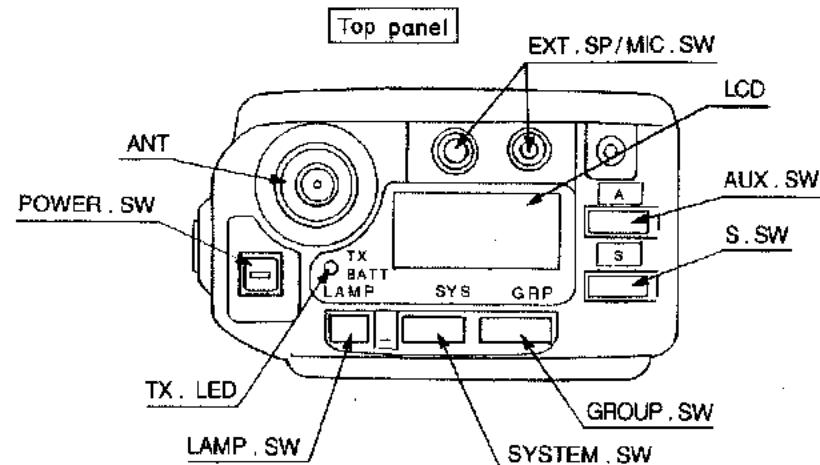

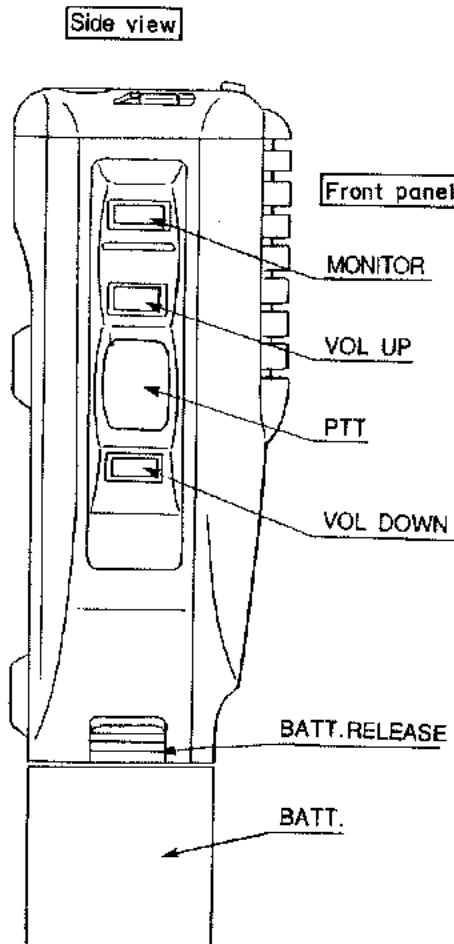

Fig. 1

# OPERATING FEATURES

- **Alphanumeric Display**

The four-digit alphanumeric (A/N) display also shows system and group numbers. Up to 160 sets of 4-digit alphanumeric displays can be programmed for each system/group. If the alphanumeric display is not programmed, the system and group numbers are displayed.

- **Auxiliary 1 (•) indicator**

The dot (•) mark shown at the lower right of the group indicator is an indicator that can be programmed for each system/group. If this key is programmed for a specific group function (interconnect, talk-around, scan lockout, etc.), it can be used to indicate the function.

If the KDD-4 is installed, it turns on according to the DECODE LATCH high/low.

- **Auxiliary 2 (•) indicator**

The dot (•) mark shown at the lower left of the system indicator is displayed only when the A key is set to the power change function. When the dot (•) is on, the TX power is low, and when it is off, the power is high.

- **TX/BATT indicator**

This red LED lights during transmission (it does not light during busy or TX inhibit is enabled). If the battery voltage falls below the programmed voltage during transmission, the brightness of this indicator decreases at intervals of about one second, so it can be used as the battery voltage alert function (except during linking).

## 3. Details of Features

### 3-1. System Scan

System scan can be selected with the "S" key by programming the scan feature. When the "S" key is pressed and the (S) mark appears, scan mode is entered. Scanning starts from the system following the currently displayed system. When scanning, a dash (--) is indicated on both the SYSTEM and GROUP indicators. When a call is received, scanning stops, and the system and group are displayed.

When the system or group key is pressed during scanning, the scan stops and the revert system or group can be changed. Scanning resumes one second after the key is released. If the scan feature is not programmed, the "S" key on the top panel is ineffective.

### 3-2. System Lockout

The system lockout feature is used to lock systems out of the scan sequence, and can be selected by programming in the following two ways:

- **Fixed lockout**

The system to be locked out is selected by programming. When a locked system is selected, the Delete (►) indicator appears on the left of the SYSTEM indicator. The revert system is scanned even if it is locked out. If there is a locked system, the Delete (►) indicator flashes during scanning.

- **User selectable lockout**

If the A (Auxiliary) key is programmed for the scan lockout feature, the user can lock systems out of the scan sequence with the A key. To lock a system out of the scan sequence, press the A key when the system is displayed. The Delete (►) indicator is displayed on the left of the SYSTEM indicator.

To unlock a system, select the system and press the A key. The Delete (►) indicator disappears to indicate that the system has returned to the scan sequence. The revert system is scanned even if it is locked out. If there is a locked system, the Delete (►) indicator flashes during scanning. If all systems are locked out, the scan stops and only the revert system is received.

If another function is assigned to the A (Auxiliary) key, the USER SELECTABLE LOCKOUT feature does not function.

### 3-3. Drop-Out Delay Time (Scan Resume Time)

If a call is received during scan, the scan stops. The scan resume time can be programmed as 0 to 254 seconds in one-second increments. The default value is 3 seconds.

### 3-4. Dwell Time

The dwell time is the time after transmission ends until the scan resumes in scan mode. It can be set to 0 to 254 seconds by programming. The default value is 15 seconds.

### 3-5. System/Group Revert

System/Group revert can be programmed for one of the following:

- **Last call revert**

The system or group changes to the revert system or group when a call is received with the system or group being scanned.

- **Last use revert**

If a system/group call is received during scanning and the PTT button is pressed for transmission and response within the drop out delay time, the system or group is assigned as the new revert system or group.

# OPERATING FEATURES

## 3-6. Scan Message Wait

The time for staying with the home repeater that receives a signal during system scan and monitoring data messages can be programmed. If there is no signal from the home repeater, the system is scanned for about 50ms. If there is a signal, three data messages are monitored. Normally, three data messages are monitored for each system, and it can be increased in multiples of three data messages per line to up to eight lines.

If the repeater data message indicates that there is no call, data monitoring is terminated and the home repeater of the next system is scanned.

## 3-7. Call Indicator

The call indicator can be programmed for each group. In trunked systems, it can be set to respond to a selectable decode ID or one of two fixed IDs, except block IDs. When a call is received with a selectable decode ID, the call indicator flashes. When a call is received with a fixed ID, the call indicator lights continuously.

In a conventional system, the call indicator can be programmed to light for each QT or DQT code. It keeps flashing while a call is being received. It is turned off by pressing any top-panel key except the LAMP key.

## 3-8. Time-Out Timer

The time-out timer can be programmed in 15 seconds increments from 15 seconds to ten minutes for dispatch and interconnect operations. If the transmitter is keyed continuously for longer than the programmed time, the transmitter is disabled and a warning tone sounds while the PTT button is held down. The alert tone stops when the PTT button is released. The default value is one minute for dispatch and three minutes for interconnect.

## 3-9. Priority ID Codes

The priority of the programmable decode ID codes for each system is as follows:

- 1) Fixed ID code 1.
- 2) Fixed ID code 2
- 3) Selected ID code
- 4) Other selectable ID codes (Group scan only)
- 5) Block decode codes

When a call with a higher priority is received, that call is received immediately (except when the transceiver is trunked out).

## 3-10. Group Scan Operation

Group scan can be programmed for each group. In addition to the ID codes of the selected group, the ID codes of the other groups that are permitted for group scan are decoded. (The two fixed ID and block decode codes are always decoded.)

If, during group scanning, a call is received with one of the selectable group ID codes for which group scan is enabled, the group display indicates the group number that the call came in with. That group then becomes the new selected group. Group scan resumes after the specified drop-out delay time or dwell time shared by the system scan elapses.

## 3-11. Transmit Inhibit

The transceiver can be programmed with a transmit inhibit block of ID codes. If an ID code within this block is decoded the preset time before the PTT button is pressed, transmission is inhibited. The BUSY indicator lights and a busy tone sounds until the PTT button is released to indicate that transmission is not possible (except clear-to-talk mode).

Transmission with the group for which the encode ID is not set is inhibited, and the busy tone is output while the PTT button is held down, regardless of the clear-to-talk setting.

## 3-12. RIC ID Codes (RIC MODE)

The ID code in the RIC ID block can be used to make a phone call by programming the block. To make a phone call, the transceiver front panel must be replaced with the optional KDM-6 (DTMF keypad).

## 3-13. Free System Ringback

This feature is available only when a telephone interconnect ID code is selected. If a busy tone sounds when the PTT button is pressed, the transceiver enters this mode automatically.

When the PTT button is released, a beep sounds for 400ms to indicate that the mode has been entered. If the scan is on, it is canceled automatically (the  mark goes off.) When any repeater becomes available, a ringing tone sounds and this mode ends.

System scan is automatically terminated when the mode is entered. The mode is terminated when the system, group, scan, PTT, or A key is changed.

## OPERATING FEATURES

**3-14. System Search**

This feature can be programmed to automatically access other programmed systems when the selected system cannot be accessed. If an intercept tone sounds when the PTT button is pressed after setting the mode, the transceiver has entered the mode. System scan is automatically terminated at this point.

If the group ID is a telephone interconnect ID, the transceiver then attempts to access, in succession, other systems that have a telephone interconnect ID in the revert group location. If the group ID is a dispatch ID, the transceiver attempts to access other systems that have a dispatch ID programmed in the revert group location.

If there is no system to be accessed, an intercept tone sounds, the mode is terminated, and the transceiver returns to the first system. If the access is successful, the mode is terminated, and the searched system becomes the new selected system.

**3-15. Transpond**

This feature can be programmed to turn on and off for each group. If the ID of the group for which transpond is enabled is received, two data messages (transmit ID and turn-off code) are automatically transmitted if the PTT button is not pressed as a response within the time set (0 to 254 seconds in 1-second increments). If the PTT button is pressed within the time, or if the signaling option has been set, the transpond is not performed.

**3-16. Talk-Around**

This feature can be programmed to turn on or off for each group. When the PTT button is pressed for the group to which the talk-around feature is set, the home repeater channel is used for transmission, and the repeater link operation is not performed. Signaling must be in LTR format.

If clear-to-talk is set, a proceed tone is output at the beginning of transmission. If both interconnect and talk-around are set, the talk-around operation is not performed.

**3-17. Preferred System Revert**

This feature is available by assigning this feature to the A (Auxiliary) key. The feature is used to move the revert system/group to the fixed programmed system/group quickly. When the A key is pressed during scanning, the scan stops temporarily, and the revert system/group is displayed. The scan resumes about one second after the A key is released.

**3-18. Alphanumeric Display Select**

The system/group number display and the alphanumeric display can be switched with the A key by assigning this feature to the key. Figure 2 shows the characters that can be displayed. These are basic characters, and can be displayed in each segment. Four digits can be displayed at the same time.

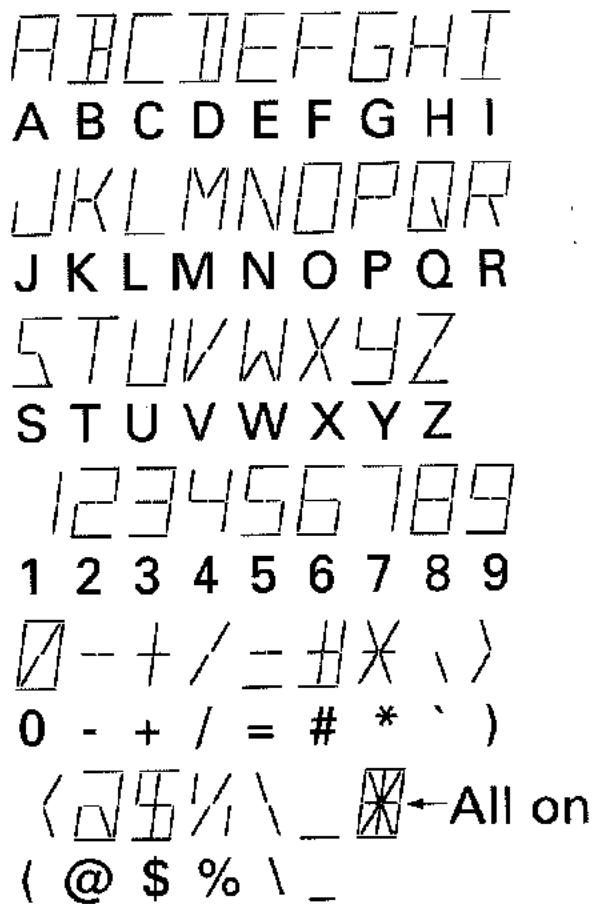

Fig. 2

## OPERATING FEATURES

### 3-19. AUTO TEL

A telephone interconnect call can be made by simply pressing the A (Auxiliary) key by assigning this feature to the key. This feature accesses the RIC channel of the available system automatically.

When the A key is pressed, a queue tone is output, and the "RIC" message appears on the alphanumeric display to indicate that this mode has been entered. If the RIC ID is set for the revert system, the RIC channel of that system is accessed. If all RIC channels are busy, an attempt is made to access the RIC channels of another system in which the RIC ID code has been programmed. It is repeated for 60 seconds until the access succeeds. If the access succeeds, a dial tone returns from the repeater. If the A key is pressed again when the queue tone is sounding, this mode is canceled.

If the access fails after 60 seconds, a deny tone is output and this mode is terminated. When the talk ends, the revert system/group returns. When the scan mode is effective, the scan resumes. The AUTO TEL feature can be programmed to turn on or off for each system.

### 3-20. Low Battery Indicator

If the battery voltage falls below the programmed level during transmission, the brightness of the TX LED is reduced in periods of one second to give an alert.

It can be programmed in the range 5.20 to 6.8V in increments of 0.2V. Normally, set it to 6.2V. This transceiver sounds an alert tone and inhibits transmission if the battery voltage falls below 5.2V.

### 3-21. TX Power Switching Feature

Transmission power can be programmed to high or low for each group. The A key can be used by assigning this feature to the key.

- **When the A key is not used**

Set the program item to YES to set the power to low. (NO : High)

- **When the A key is used**

You can switch the transmission power between high and low with the A key by assigning this feature to the key.

If the A key is pressed once, the [ • ] indicator on the system display lights and the power becomes low. (The 1460-Hz confirmation tone sounds once.)

If the A key is pressed again, the [ • ] indicator goes off and the power becomes high. (The 1460-Hz confirmation tone sounds twice.)

### 3-22. Audible User Feedback Tones

The transceiver outputs various combinations of three tones (high, mid, and low) to notify the user of the transceiver operating state. The main tones are listed below. The high tone is 1460Hz, the mid tone is 980Hz, the and low tone is 730Hz.

- **Busy tone**

This tone is output when the PTT button is pressed but no repeater is available and transmission is not possible. It is output until transmission is enabled while the PTT button is held down and transmission starts, or until the PTT button is released. (The mid tone and low tone are output alternately in 150ms intervals.)

- **Intercept tone**

This tone indicates that the transceiver is out of range. It indicates that the PTT button is pressed, and transmission has started, but the repeater cannot be connected and talking is not possible. It is output until the PTT button is released. (The mid tone and low tone are output alternately in 200ms intervals.)

- **Delay tone**

This tone is output when the PTT button is pressed and the repeater is accessed three times or more to indicate connection with the repeater is delayed. This tone is the same as the Busy tone.

- **Proceed tone**

This tone is output when the PTT button is pressed, transmission starts, and the repeater is connected to indicate that the user can talk if the Clear-to-Talk function has been set. (The high tone is output for 100ms.)

- **Queue tone**

This tone is output until the AUTO TEL function is set and the RIC channel is accepted successfully. (The mid tone on for 50ms, off for 50ms, and on for 50ms in 1 second intervals.)

- **Deny tone**

This tone is output if the AUTO TEL function is set, the queue tone is output, but the RIC channel cannot be accessed within 60 seconds. It is similar to the intercept tone. (The mid tone and low tone are output alternately in 150ms intervals.)

# OPERATING FEATURES

### **3-23. Clear-to-Talk**

This feature can be programmed to turn on or off.

- **Clear-to-talk operation (Set to ON)**

If a dispatch ID is used and the PTT button is pressed when no repeater can transmit, a busy tone is not output (it is output when an interconnect ID is used). If transmission becomes possible while the PTT button is held down, transmission starts.

When connection with the repeater is completed, a proceed tone is output. The delay tone is not output in this mode. (It is output when an interconnect ID is used.)

- **Normal operation (Set to OFF)**

If the PTT button is pressed when there is no repeater that can transmit signals (no free repeater or TX inhibit is enabled), a busy tone is output. If transmission becomes possible while the PTT button is held down, transmission starts. The delay tone is output if link operation is performed three to six times.

### **3-24. Conventional System Operation**

Up to 10 channels can be programmed for each system programmed as a conventional system. Channels can be selected by the group key. This transceiver can program up to 160 channels.

QT (Quiet-Talk), DOT (Digital Quiet-Talk), or carrier squelch can be set for transmit or receive channels. If signaling is set for transmission, a squelch tail eliminator (reverse burst or turn-off code) is transmitted.

- **Monitor operation**

If QT or DQT signaling is set during reception, it can be canceled by pressing the monitor key. This feature can be programmed to be disabled.

- **Talk-around**

The Talk-around feature can be programmed for each channel.

- **Transmit disable (receive-only channels)**

Transmission can be programmed to be inhibited for each channel. This feature is used to set receive-only channels. When the PTT button is pressed on a receive-only channel, a busy tone sounds, and transmission is not performed.

- **Busy channel lockout**

The busy channel lockout feature can be programmed for each channel. If a channel is locked out by pressing the PTT button, a busy tone is output, and if transmission becomes possible, it starts.

- **Scanning conventional systems**

For the conventional system scan, only the revert channel of each system is scanned. If QT or DQT is set for the channel, the channels, including signaling, are scanned.

### **3-25. DTMF Key Panel (KDM-6 Option)**

The 0 to 9, \*, and # keys are used to generate DTMF tones for telephone number dialing. A DTMF tone is generated only when transmission is performed by pressing the PTT button.

### **3-26. External Decoder (KDD-4 Option)**

The optional DTMF decoder (KDD-4) can be installed in the transceiver. Use of the optional decoder can be programmed for each group (for each channel of a conventional system). The monitor key functions as the external decoder reset key.

The KDD-4 can be supported with the decode ID of each group. If the decode ID of group 1 is equal to fixed ID 1 or the decode ID of group 2 is equal to fixed ID 2 in the LTR system, the KDD-4 can be supported with each fixed ID. If it is supported, the following features are available:

- **Audio mute**

If the decode latch input port is low during reception and the LTR data or signaling matches (when the squelch is open if signaling is not set), the audio is output.

During system/group scanning, the "— —" display changes to the system/group display (or alphanumeric display). If it is the last call, the revert system/group returns.

- **Call indicator, alert tone**

If the Decode Latch input port changes from high to low during reception and the LTR data or signaling matches (when the squelch is open if signaling is not set), a KDD-4 alert tone is output when the monitor key is off. CALL lights or flashes (or nothing occurs) according to the CALL indicator set for each group.

The CALL indicator/KDD-4 alert tone does not operate unless the Decode Latch input port goes high.

- **Operation during scan**

If signaling matches during scanning, the scan stops at the system. The display shows "— —" until the Decode Latch input port goes low. When the port goes low, the system/group is displayed.

# OPERATING FEATURES

## 4. Transceiver Programming

### 4-1. Introduction

The TK-431 transceiver is programmed using an IBM PC or compatible machine, a programming interface (KPG-8), and a programming disk (KPG-16D). Figure 3 shows the setup for an IBM PC.

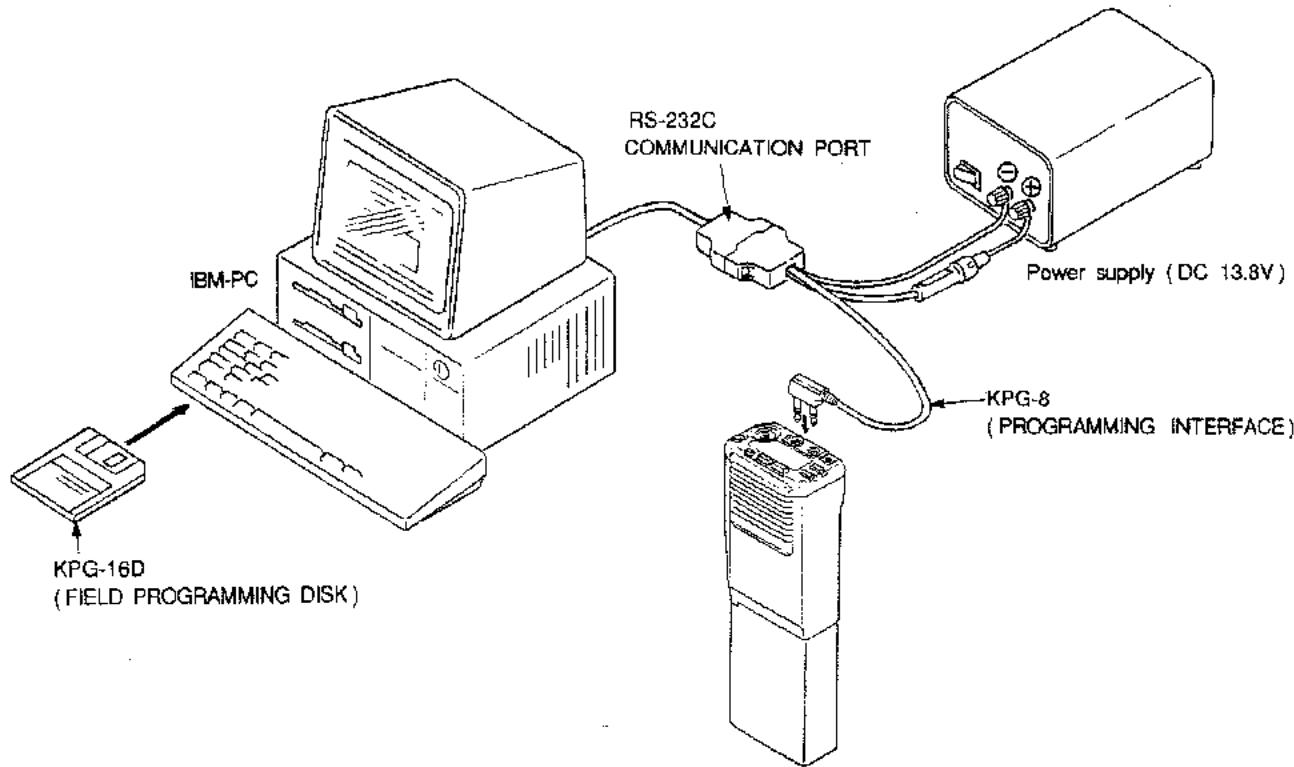

Fig. 3

### 4-2. KPG-8 Description

#### (Optional PC programming interface cable)

The KPG-8 is needed to connect the TK-431 to the computer. It has a circuit in the D-subconnector (25-pin) case that converts the RS-232C logic level to TTL level. The KPG-8 plug is connected to external socket of the TK-431 and to the computer by a conversion cable (option) with a 9-pin female connector and a 25-pin male connector. Connect the KPG-8 DC power input cable to the DC power supply (13.8V).

### 4-3. Programming Software Description

KPG-16D is the programming software for the TK-431, supplied on a 3.5" or 5.25" floppy disk. This software runs under MS-DOS (version 3.3 or later) on an IBM-PC/XT, AT, or PS2, or on a compatible machine. Data can be input to or read from the TK-431, and edited on the screen. Programmed data can be printed.

### 4-4. Program Mode

Data can be programmed in to the transceiver in this mode. To put the transceiver in to this mode, hold down the A (Auxiliary) key, switch the power on, wait for at least two seconds, then release the A key. The system or group display shows a dash (-). The message "PROG" appears on the alphanumeric display.

Firmware programming : Hold SYS Key while turning on power. Version check : Press A Key. Use 9200 baud. Use DOS FPRO.exe

## OPERATING FEATURES

**4-5. Clone Mode (Fig. 4)**

Programming data can be transferred from one radio to another by connecting them via their external microphone connectors. The operation is as follows (the transmit radio is the master and the receive radio is a slave):

1. Power on both radios.
2. Connect the KCT-8 cloning cable to the microphone connectors of master and slave.
3. Put the master into programming mode, then press the GROUP key. The dot (•) at the lower right of the group indicator goes on to indicate that the master is in clone mode.
4. Put the slave into programming mode.

5. Press the "S" key on the master. Data is transmitted to the slave and the  mark goes on. When data has been completely cloned, the  mark disappears.
6. Switch the slave's power off, disconnect the clone cable, then switch the power on again. The slave can then be operated by the same program as the master.
7. Any number of radio can be cloned by connecting the slave side of the microphone cable to the microphone connector of another radio, putting it into programming mode, and performing steps 5 and 6.

**Note :** Only the same models can be cloned together.

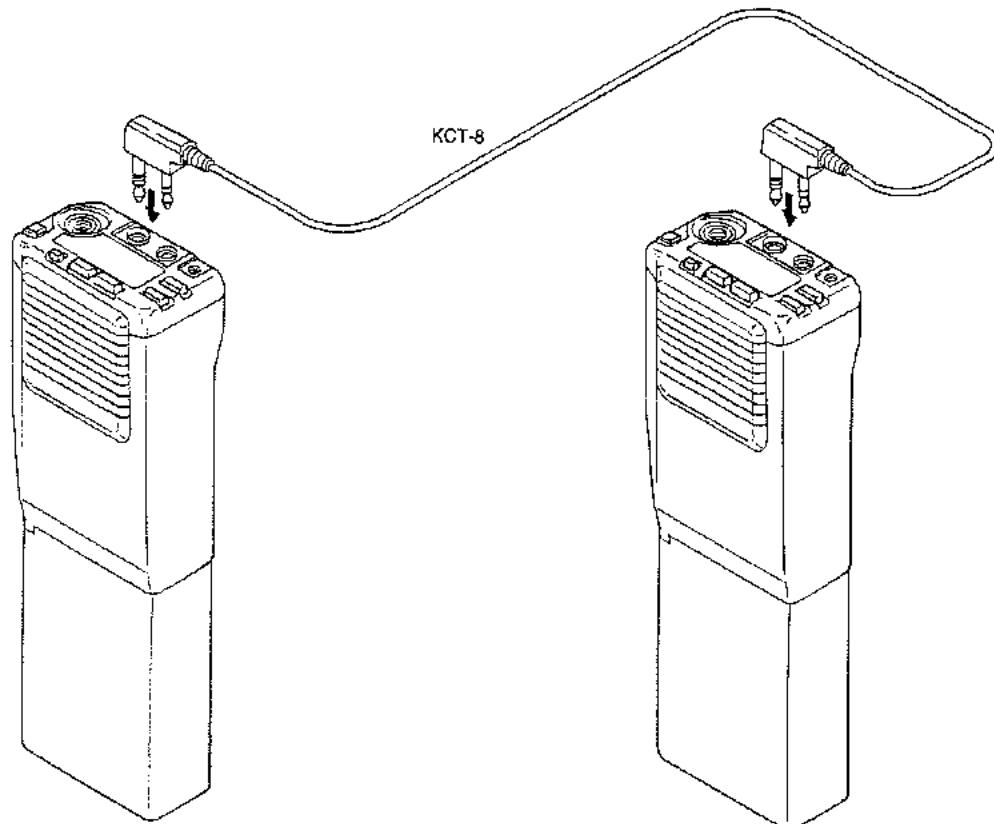

Fig. 4

# INSTALLATION

## 1. Installing the DTMF Key Panel (KDM-6 Option)

The KDM-6 is used to generate DTMF tones for dialing a phone numbers.

1. Loosen the two screws (①) securing the bottom plate, pull the top panel (②), and remove the transceiver from the case. (Fig. 5)

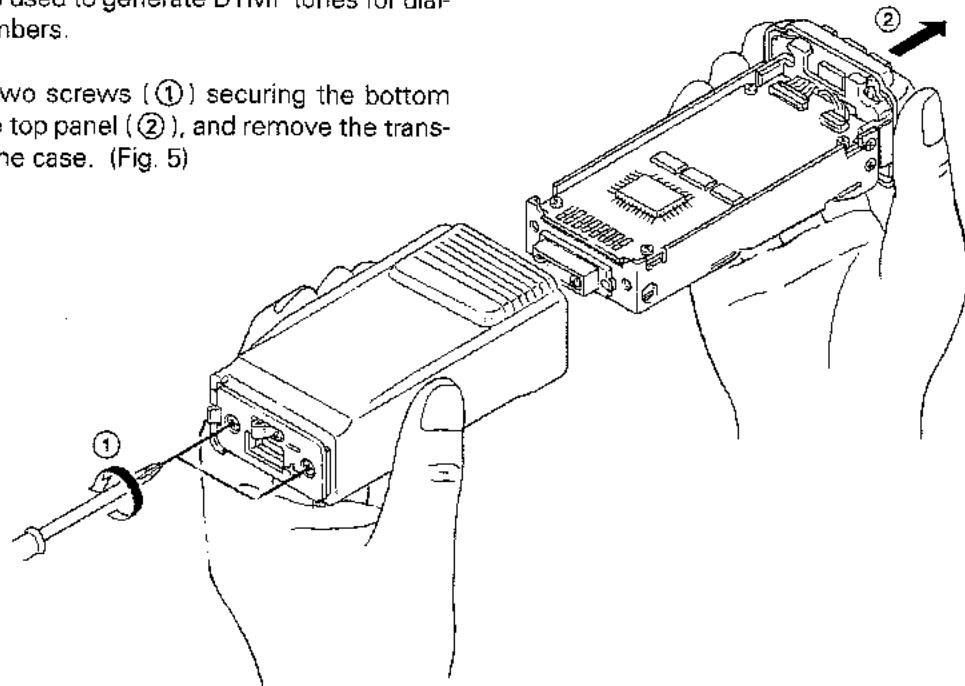

Fig. 5

2. Remove the one screw (N09-2053-05) holding the bottom plate (③), and remove the bottom plate (④). See Figure 6 for 2 to 6.

3. Remove the terminal (E23-0474-14) and cushion (G11-0617-04) (⑤).

4. Remove the release knob (⑥) and spring (G01-0867-04) (⑦).

5. Remove the front half of the case from the rear half.

**Note:** To remove the front half of the case from the rear half, push up the front panel in direction (⑧) shown in Figure 6 and remove it in direction (⑨).

6. Install the KDM-6 instead of the front panel.

Reassemble the unit in the reverse order of disassembly.

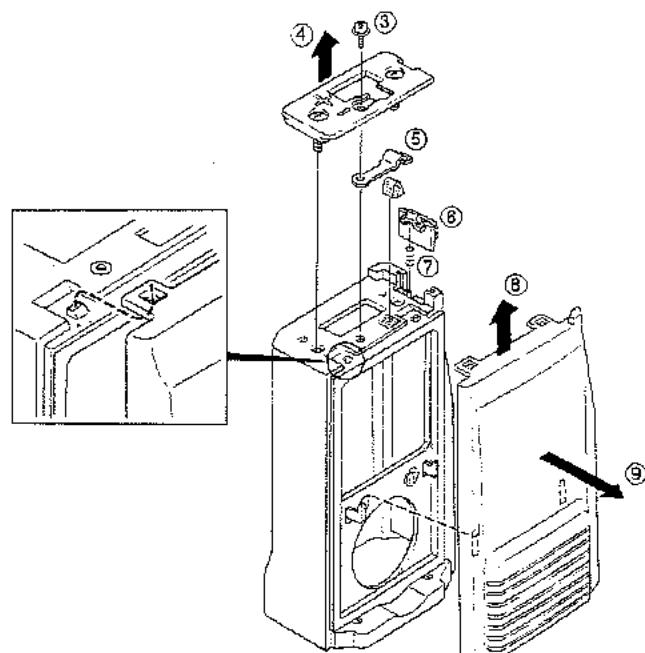

Fig. 6

## INSTALLATION

## 2. Installing the Signaling Unit (KDD-4 DTMF Option)

1. Loosen the two screws holding the bottom plate, pull the top panel, and remove the transceiver from the case. (Fig. 5)
2. Remove the four screws holding TX-RX unit B/4 on the frame.
3. Remove TX-RX unit B/4 (①). (Fig. 7)
4. Cover the entire KDD-4 with the supplied insulating tube (②).

5. Attach the double-sided adhesive cushion to the insulating tube (③) (on the insulating tube on the soldered side of the KDD-4).
6. Insert the KDD-4 lead connector into CN204 on the component side of the TX-RX unit B/4 (④).
7. Fix the KDD-4 covered with the insulating tube on TX-RX unit B/4 with the cushion facing down. (See Figure 7 for the fixing location (⑤). If it is not fixed correctly, it will touch other components.)

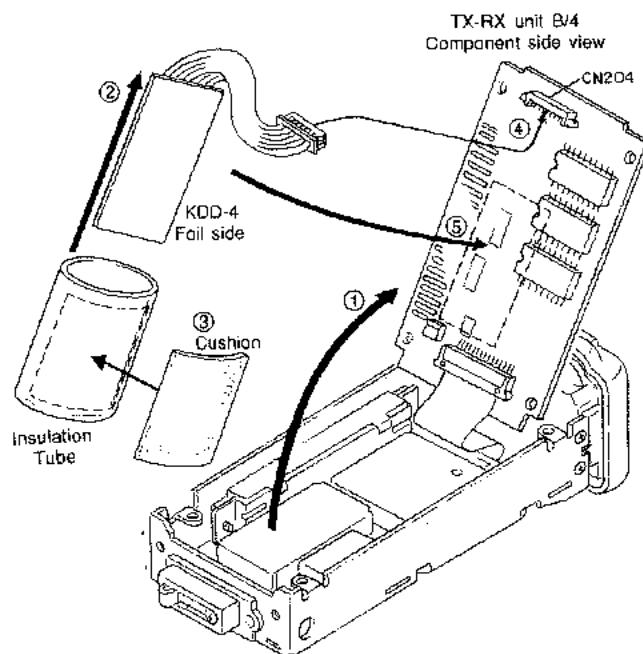

Fig. 7

### 2-1. Setting the KDD-4 Code (DTMF)

This product is built using surface mount construction techniques. The solder jumpers used to configure this product should be changed using equipment and techniques suitable for surface mount device repair. Abuse due to the use of inappropriate tools and techniques will VOID the warranty.

# DISASSEMBLY FOR REPAIR

## 1. Removing the Case, Front Panel, and Bottom Plate

See page 13 : Installing the DTMF key panel.

## 2. Disassembling the Front Panel (Fig. 1)

1. Remove the six screws (①) holding the PC board (J72-0208-02), then remove the front panel.

## 3. Removing the TX-RX unit (B/4) (Fig. 2)

1. Remove the four screws (①) holding TX-RX unit B/4, then remove the frame.
2. Remove the cable connectors (②) from CN202 and CN203.
3. Remove the cable (W1) from CN201. CN201 is located on the foil side of TX-RX unit B/4. Unlock CN201 and remove W1. To unlock it, pull the cap of CN201.

## 4. Removing the Top Panel (Fig. 2)

1. Remove the four screws (③) holding the top panel, then remove the frame.
2. Remove the solder fixing the lead connecting J2 on the component side of TX-RX unit A/4 and the antenna terminal (④).
3. Remove the solder connecting the ground pattern on the foil side of TX-RX unit A/4 and the top panel shield terminal (⑤).

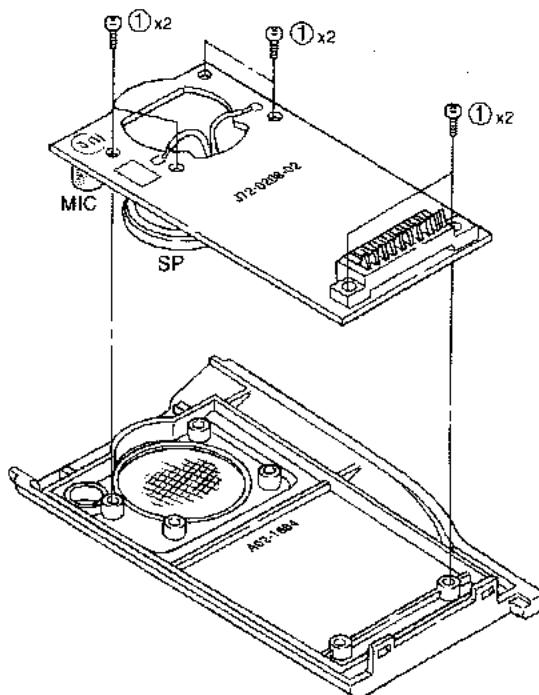

Fig. 1

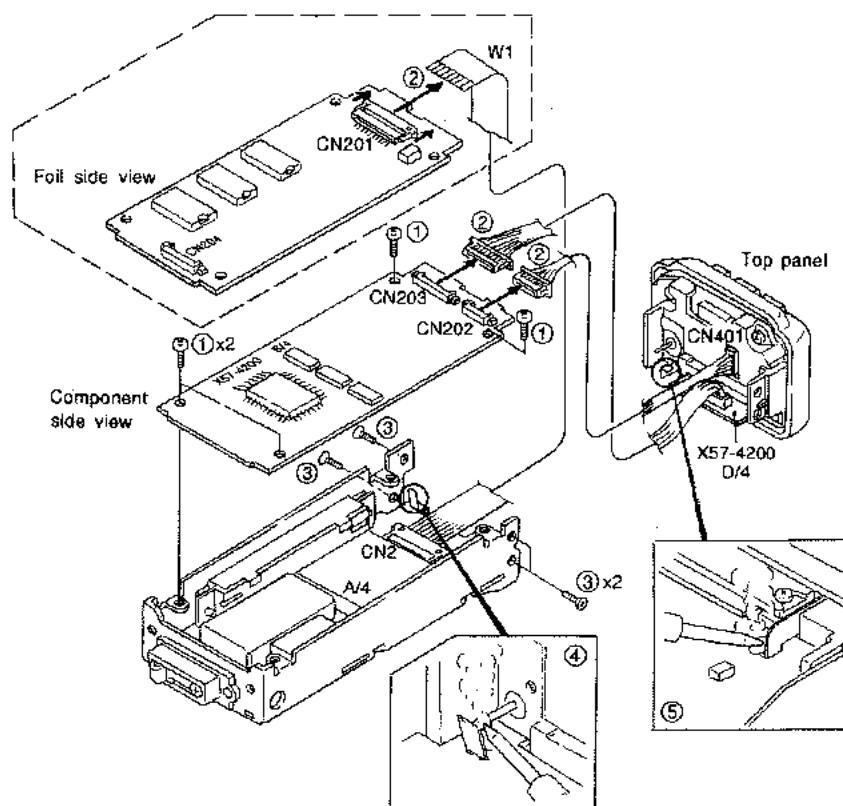

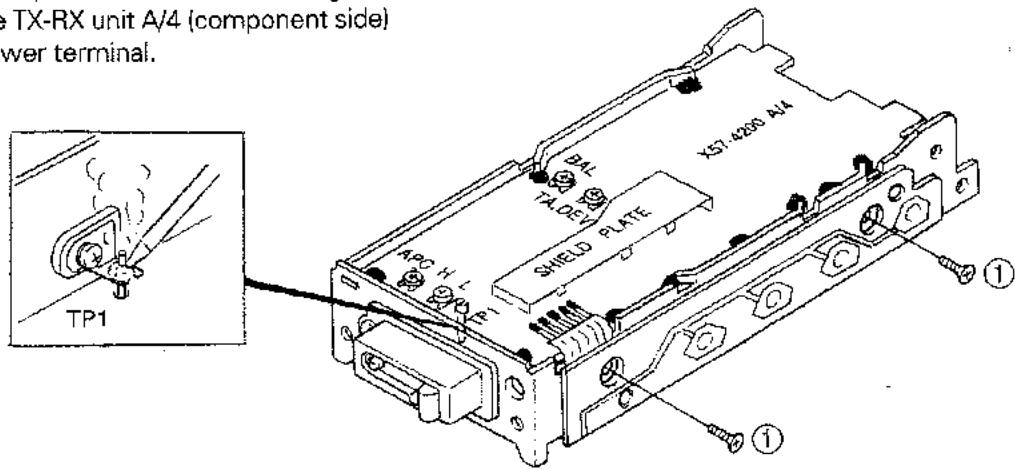

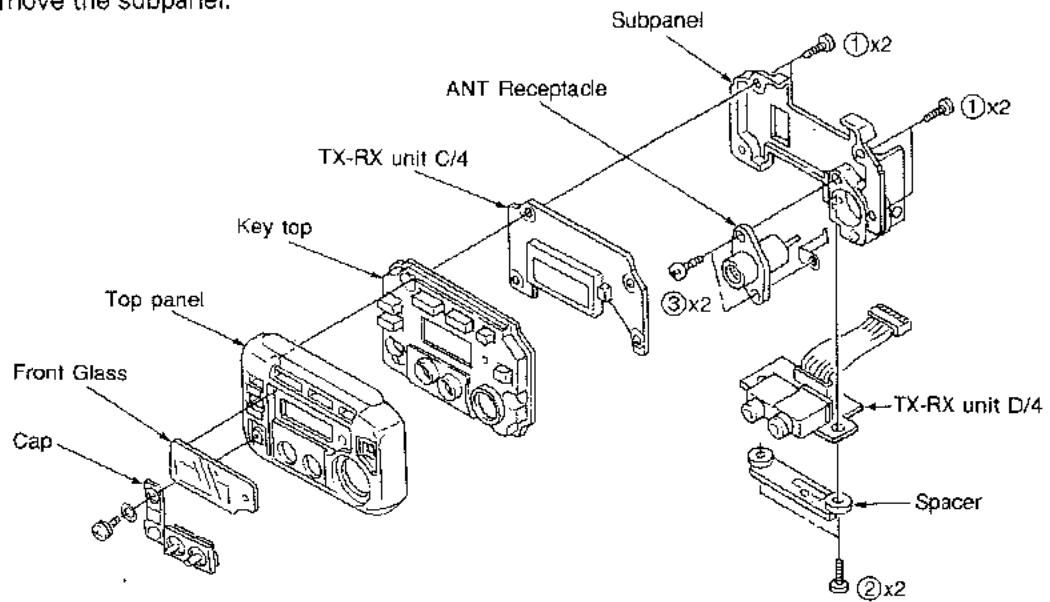

Fig. 2

**5. Removing the TX-RX Unit A/4 (Fig. 3)**

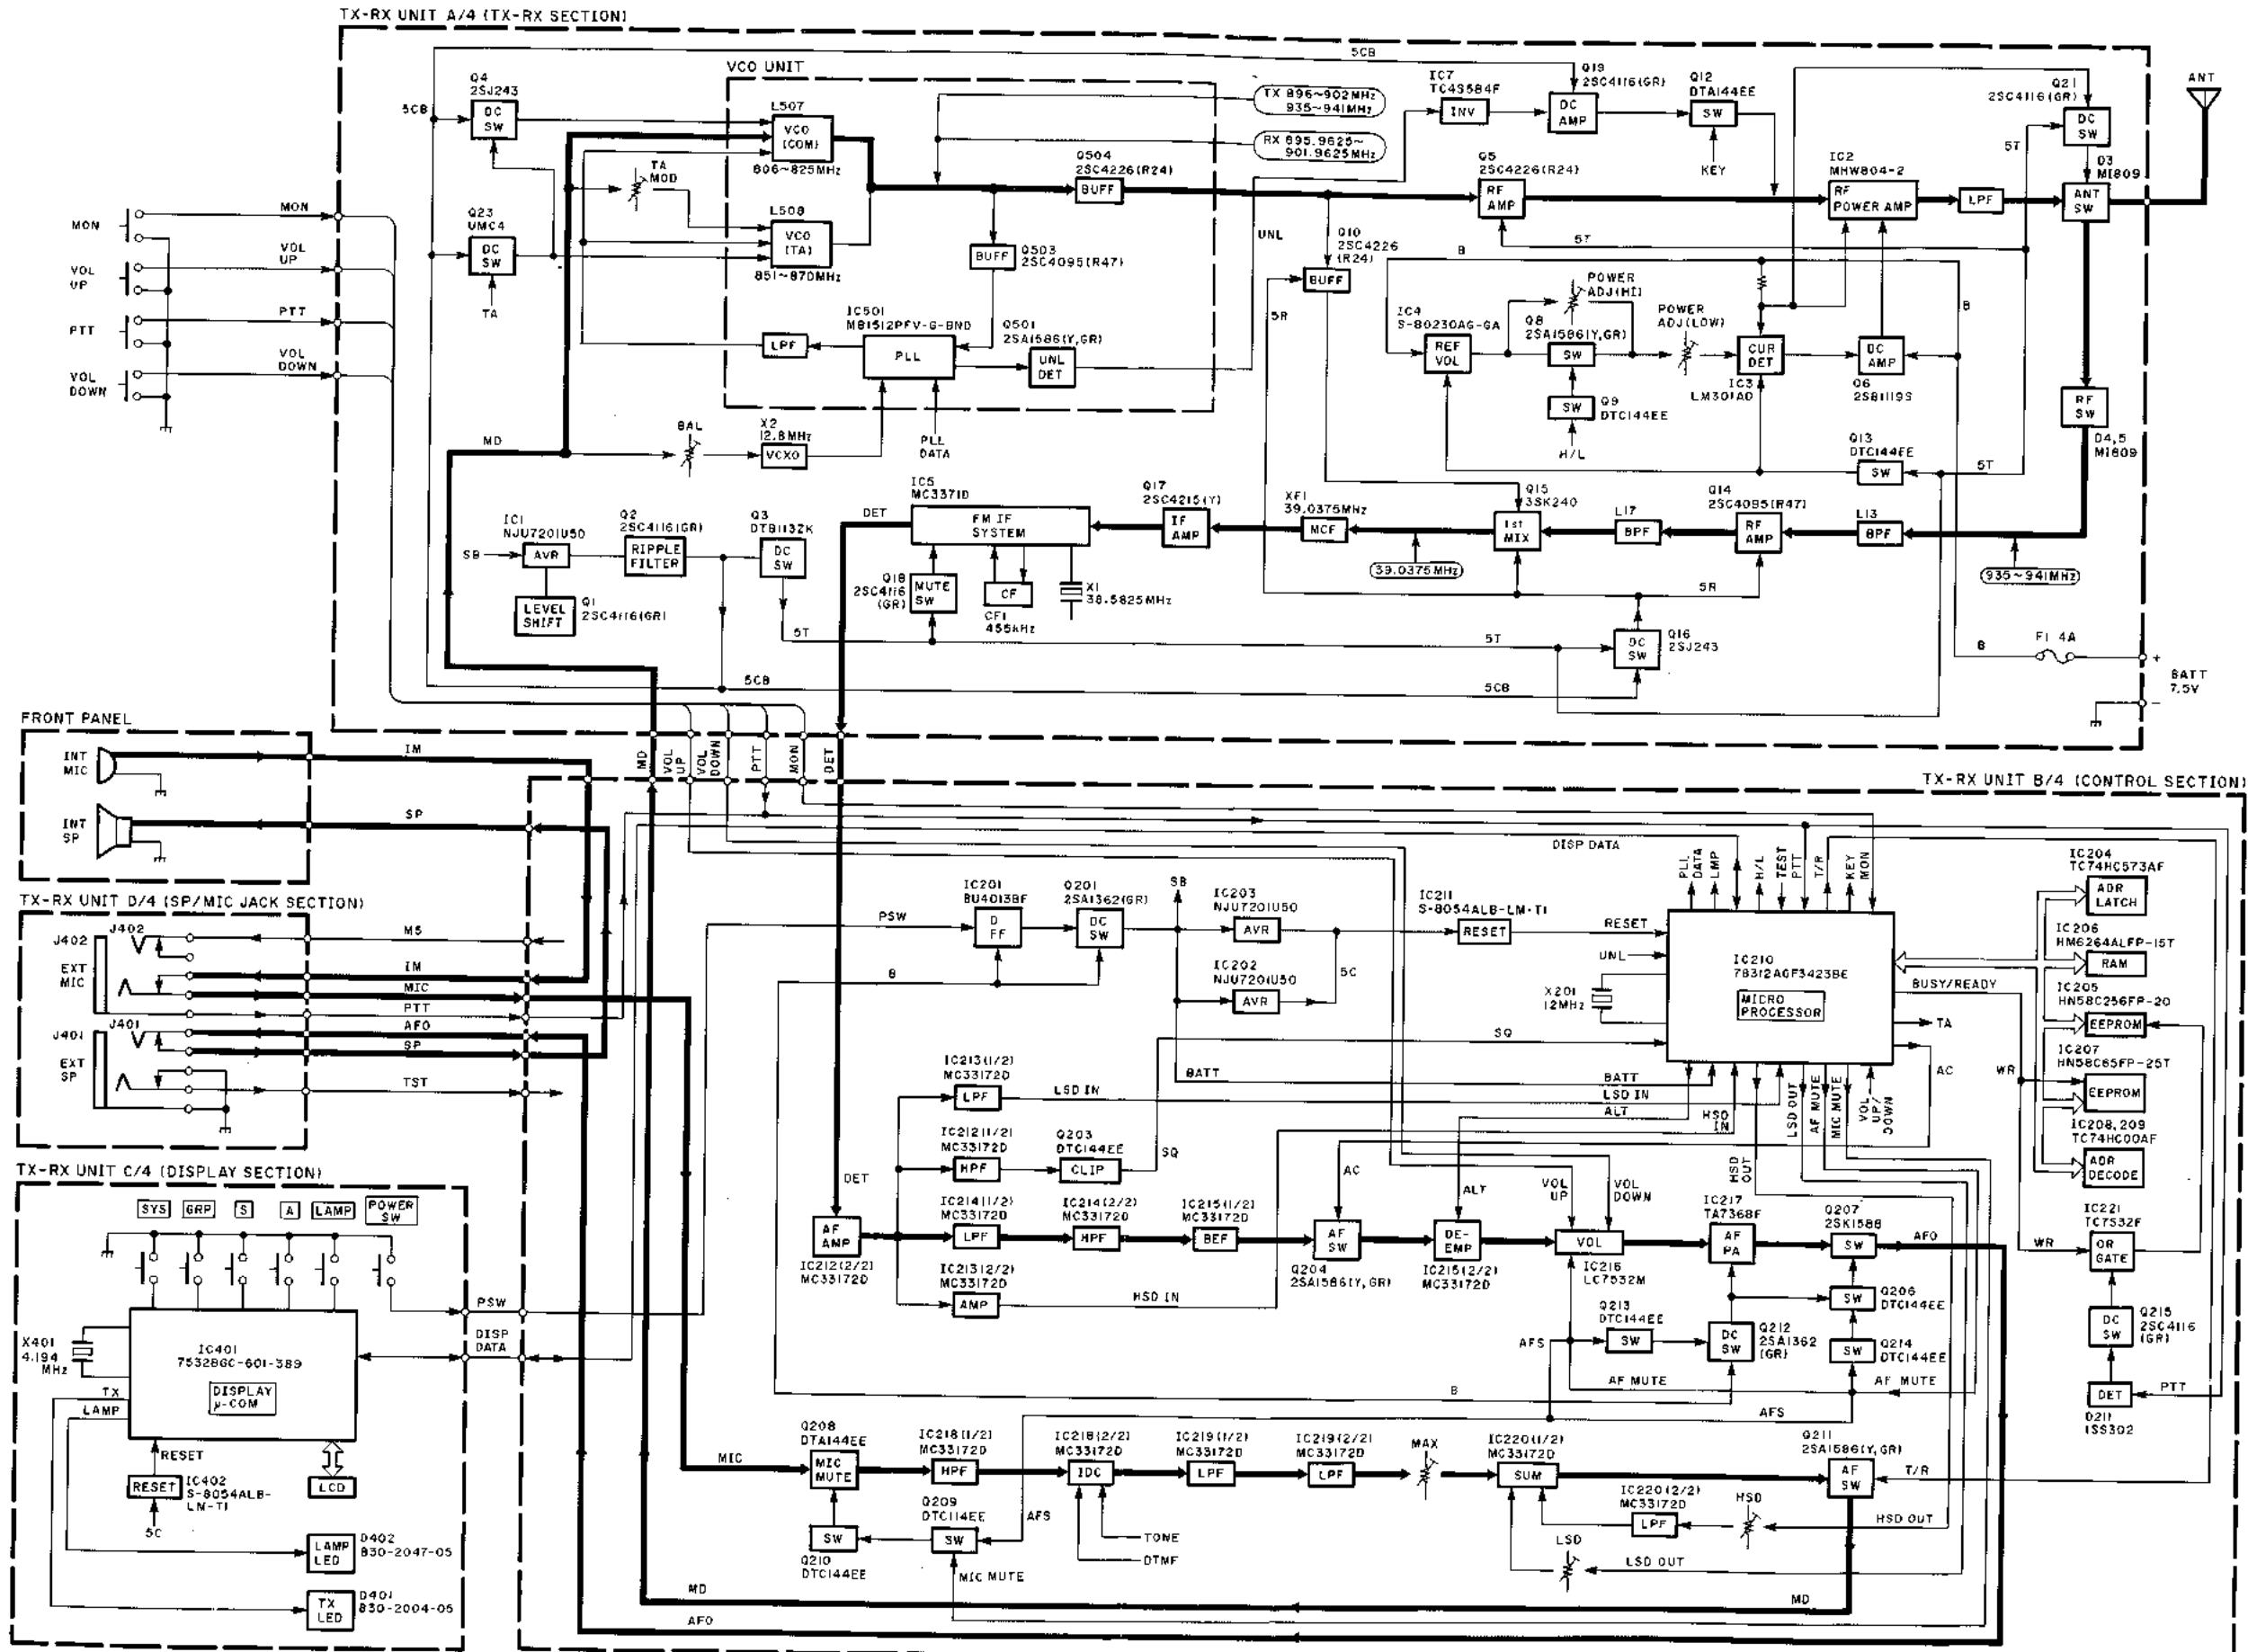

1. Remove the two screws (①) holding IC2, then remove the frame.
2. With a soldering iron, remove the solder fixing the TX-RX unit A/4 (foil side) and the frame. (Remove the solder marked with.)
3. With a soldering iron, remove the solder fixing the TP1 terminal of the TX-RX unit A/4 (component side) and the battery power terminal.

**Fig. 3****6. Disassembling the Top Panel (Fig. 4)**

1. Remove the four screws (①) holding the top panel, key top, and TX-RX unit C/4, then remove the subpanel.
2. Remove the two screws (②) holding TX-RX unit D/4 and spacer, then remove the subpanel.
3. Remove the two screws (③) holding the ANT receptacle, then remove the subpanel.

**Fig. 4**

# TK-431 TK-431 BLOCK DIAGRAM

# CIRCUIT DESCRIPTION

## 1. Overview

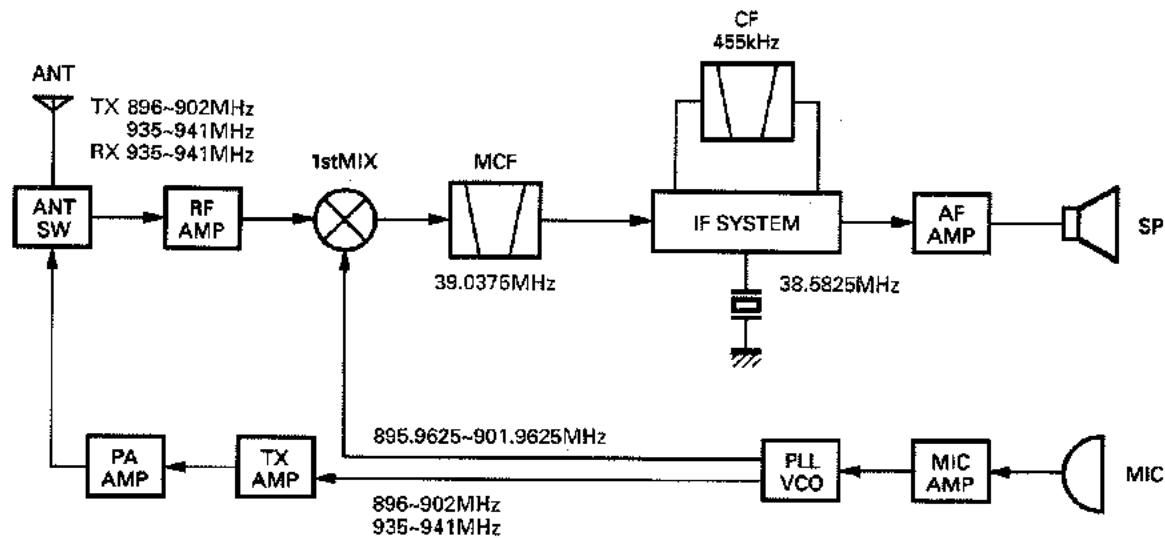

This transceiver is an 900-MHz-band EFJ LTR™ trunked-system-compatible FM portable transceiver that can be programmed to operate on both LTR and conventional systems.

## 2. Circuit Configuration by Frequency

The receiver is a double-conversion superhet with a first intermediate frequency (IF) of 39.0375MHz and a second IF of 455kHz. Incoming signals from the antenna are mixed with the local signal from the PLL to produce the first IF of 39.0375 MHz.

This is then mixed with the 38.5825MHz second local oscillator output to produce the 455Hz second IF. This is detected to give the demodulated signal.

The transmit signal frequency is generated by the PLL VCO, and modulated by the signal from the microphone. It is then amplified and sent to the antenna.

**Fig. 1 Frequency configuration**

## 3. Receiving System

### 3-1. RF unit

An incoming RF signal from the antenna terminal passes through the antenna switch (D3, D4, and D5 are off) and then the bandpass filter (L13). The signal is amplified by RF amplifier Q14, and passes through the bandpass filter (L17) again. The resulting signal goes to the first mixer (Q15), where it is mixed with the first local oscillator signal output from the frequency synthesizer to produce the first IF (39.0375MHz).

### 3-2. IF unit

The first IF signal then passes through a four-pole monolithic crystal filter (XF1). The signal is amplified by first IF amplifier Q17 and goes to the second IF unit.

The second IF unit consists of an IF system IC (IC5) and the second mixer, second local oscillator, second IF filter, and FM detector. IC5 mixes the signal input to it with the 38.5825MHz second local oscillator output of the crystal oscillator (X1) to produce the second IF of 455kHz.

The 455kHz signal then goes through 455kHz ceramic filter CF1, is amplified by the limiting amplifier, demodulated by the quadrature FM detector (in the same IC), and output to the receive audio amplifier.

## CIRCUIT DESCRIPTION

## 3-3. Audio amplifier unit

The demodulated signal is amplified by IC212 (2/2), and goes through a low-pass filter consisting of IC214 (1/2), a high-pass filter consisting of IC212 (2/2), and a BEF consisting of IC215 (1/2) to remove the audio signal.

The signal then goes through a AF switch (Q204 : ON), the deemphasis circuit consisting of IC215 (2/2), and an electronic volume control circuit consisting of IC216, the on to audio power amplifier IC217, where it is amplified and output to the speaker.

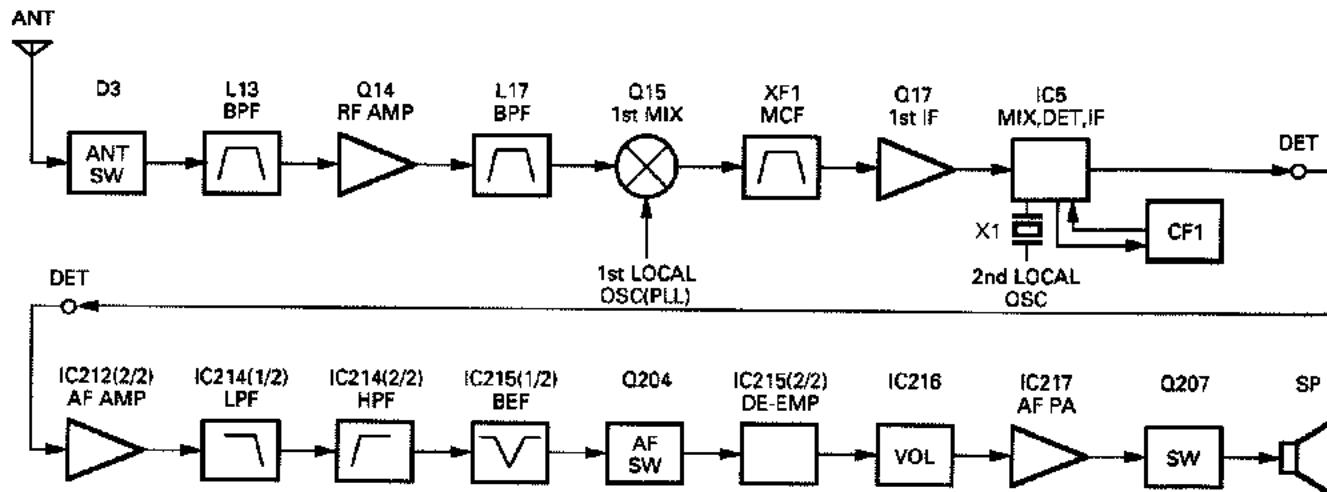

Fig. 2 Receiving system

## 3-4. Squelch circuit

The receive detector output is amplified by IC212 (2/2), then passes through a high-pass filter consisting of IC212 (1/2) to remove the noise component from the signal. It passes through Q203, and the noise pulse signal is sent to pin 20 of the CPU (IC210).

The CPU counts the pulse signals and performs digital integration. It reads the voltage across the preset squelch semi-fixed resistor (VR201) via pin 29, compares the voltage with the integration value, and turns the squelch on and off accordingly.

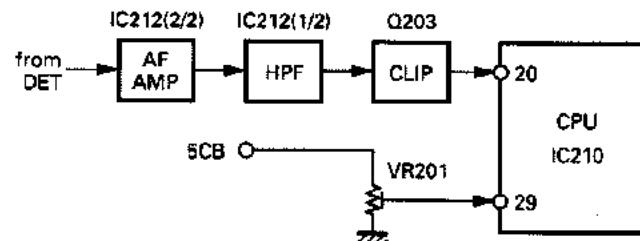

Fig. 3 Squelch

# CIRCUIT DESCRIPTION

## 4. Transmitter System

### 4-1. Microphone amplifier

The signal from the microphone goes through the microphone mute switch (Q208 : ON). It passes through the high-pass filter in IC218 (1/2) and the preemphasis/IDC circuit in IC218 (2/2). (The output is mixed with the encode signal if an option is installed.)

The signal then passes through the four-stage low-pass filter consisting of IC219 (1/2, 2/2), and unwanted harmonics are removed.

The signal passes through the MAX DEV adjustment VR (VR202), and enters the summing amplifier consisting of IC220 (1/2), and is mixed with the low speed data from the CPU (IC210).

The output signal from the summing amplifier passes through the AF switch (Q211 : ON), and goes to the VCO and VCXO modulation input.

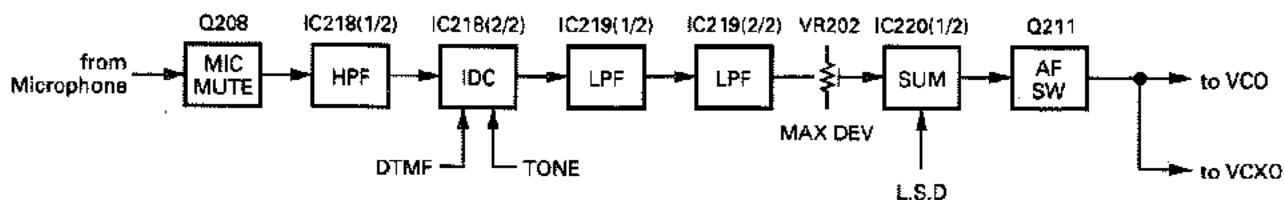

Fig. 4 Microphone amplification

### 4-2. Final amplifier

The signal from the PLL (Q5 : RF amplifier output) passes through the 3dB attenuator and is amplified by the RF power amplifier (IC2) to 2.5W (1W when the power is low). It then goes through the harmonic filter (LPF) and antenna switch (D3 : ON), and on to the antenna terminal.

### 4-3. APC circuit

The current flowing through the RF power amplifier (IC2) is always monitored by detecting the voltage drop at resistor R37. This voltage is applied to pin 2 (non-reverse pin) of IC3.

The reference voltage from IC4 is applied to pin 3 of IC3. The power is amplified according to the difference with the reference voltage and so the DC amplifier (Q6) is controlled to keep the transmission power current and the transmission output constant. Q8 is normally off, and turns on when lower power mode is selected.

This switches the reference voltage (IC4, pin 3) and power high/low (2.5W/1W). The power level can be adjusted by VR2 (high power) or VR3 (low power).

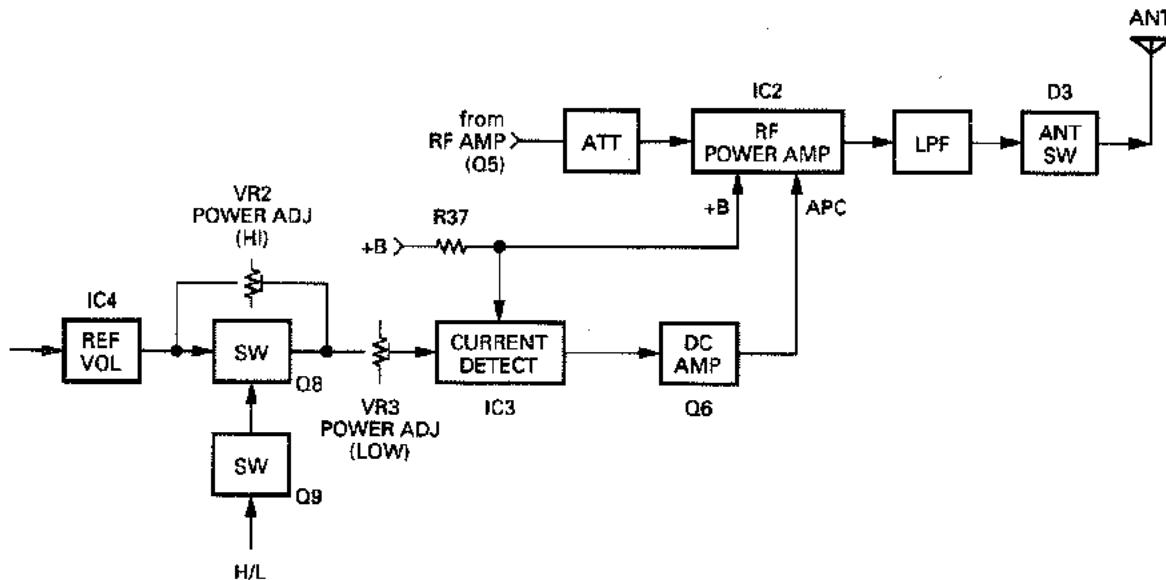

Fig. 5 Transmit power circuit and APC circuit

## CIRCUIT DESCRIPTION

## 5. Frequency Synthesizer Unit

## 5-1. PLL

The frequency synthesizer consists of a VCXO (X2), a VCO (L507, L508), a PLL circuit, and peripheral circuits.

The VCXO generates 12.8MHz. The frequency stability is within 2.5ppm within the temperature range of -30 to +60°C. This output enters the PLL IC (IC501), and is divided by 1024 to produce a 12.5kHz reference signal.

The VCO output passes through the buffer amplifier (Q503) and is sent to the PLL IC. The phase of this signal is compared with the 12.5kHz reference signal in the IC. The output from the phase comparator goes through the charge pump and is directed to the external low-pass filter.

The signal is applied to the VCO F. C. terminal and is locked to keep the VCO frequency constant.

The other VCO output passes through the buffer amplifier (Q504), is amplified by Q5 in transmit mode and by Q10 in receive mode, and is output to the transmit circuit or receive circuit.

There are two VCOs. L508 operates only if talk-around (TA) mode is selected in transmit mode. Otherwise, L507 operates. The VCO oscillation frequencies are as follows:

L507 : 896 to 902MHz

L508 : 935 to 941MHz

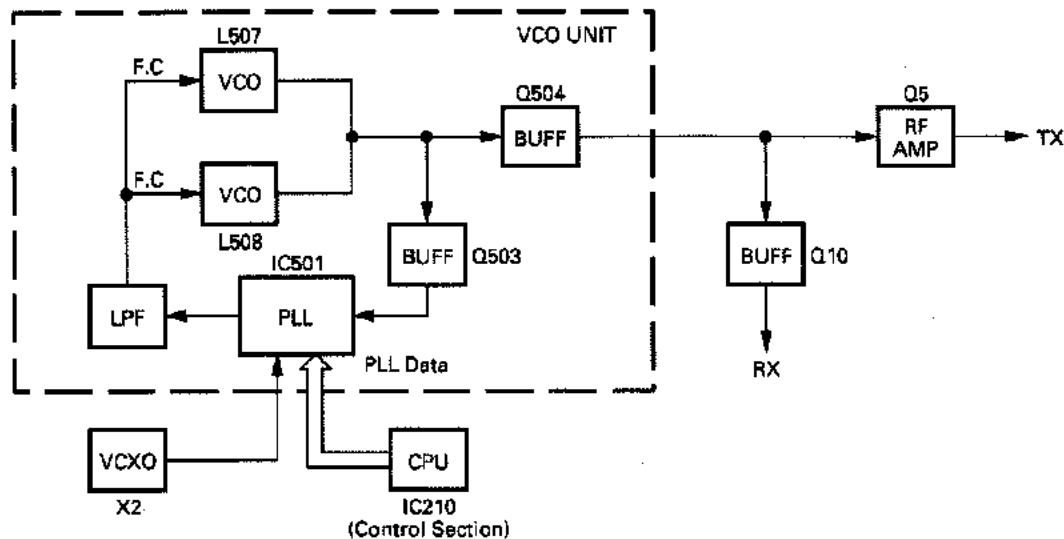

Fig. 6 PLL unit block diagram

## 5-2. PLL unlock

When the PLL is unlocked, the lock detect signal (LD) of the PLL IC (IC501) is converted to a DC signal by Q501 and IC7. This signal turns Q19 off, and cuts off the V control (3.7V) of the TX power amplifier (IC2), stopping unnecessary transmission.

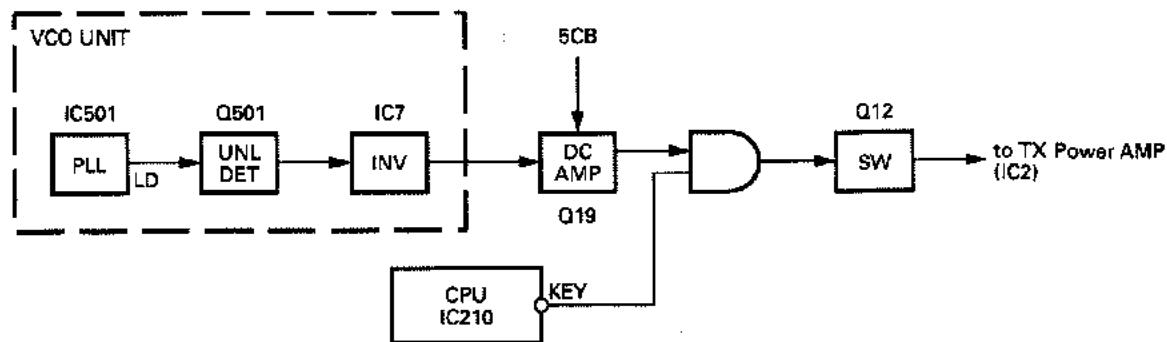

Fig. 7 PLL unlock circuit

# CIRCUIT DESCRIPTION

## 6. Control unit

The control unit consists of microprocessor IC210 and its peripheral circuits. It controls the TX-RX unit and transfers data to and from the display section. The CPU (IC210) mainly performs the following:

- 1) Switching between transmission and reception by PTT signal input.
- 2) Reading system, group, frequency, and program data from the memory circuit.
- 3) Sending frequency program data to the PLL.
- 4) Controlling squelch on/off by the pulse signal input from the squelch circuit.
- 5) Controlling the audio mute circuit by decode data input.
- 6) Transmitting tone and encode data.

### 6-1. Memory circuit

IC205 is an EEPROM with a capacity of 32K x 8 bits that contains the transceiver control program for the CPU.

This program can be easily written from an external device. Data, such as transceiver channels and operating features, are programmed into the EEPROM consisting of IC207. IC206 is a static RAM used as a data buffer.

### 6-2. TX encode data

The CPU (IC210) transmits the encode data selected by the program.

#### • Low-speed data (QT, DOT, LTR)

Low-speed data is output from pin 33 of the CPU. The signal passes through a low-pass CRfilter, and goes to the summing amplifier (IC220 (1/2)) of the microphone amplifier. The signal is mixed with the audio signal and goes to the VCO and VCXO modulation input. The modulation level of the low-speed data can be adjusted to an appropriate value with potentiometer VR203.

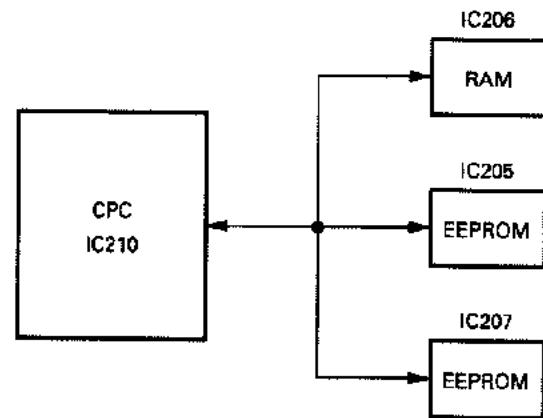

Fig. 8 Memory circuit

#### • High-speed data

High-speed data is output from pin 4 of the CPU. The signal passes through a low-pass filter consisting of IC220 (2/2) in the microphone amplifier, and goes to the VCO and VCXO modulation input. The audio signal is muted, and only high-speed data is transmitted. The modulation level of the high-speed data can be adjusted to an appropriate value with potentiometer VR204.

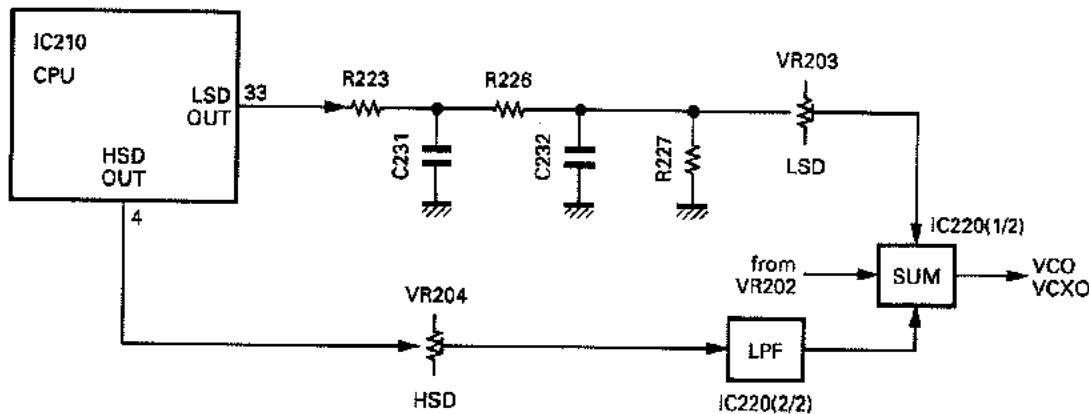

Fig. 9 TX encode data circuit

## CIRCUIT DESCRIPTION

**6-3. RX decode data****• Low-speed data (QT, DQT, LTR)**

The receive detection signal is amplified by IC212 (2/2), and passes through a low-pass filter IC213 (1/2) to remove audio components. This signal is input to pin 27 of the CPU.

The CPU digitizes this signal, performs processing such as DC restoration, and decodes the signal.

**• High-speed data**

The receive detection signal is amplified by IC212 (2/2), and goes to IC213 (2/2) (amplifier). This signal is input to pin 13 of the CPU. The CPU reads and decodes the input signal.

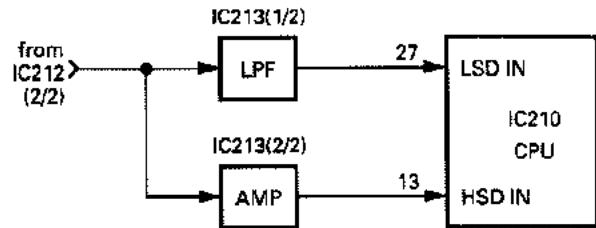

Fig. 10 RX decode data block diagram

**6-4. PLL data output**

PLL data is output from DATA (pin 62), ENABLE (pin 63), and CLOCK (pin 64) of the CPU (IC210). The signals are input to the PLL IC (IC501) when the channel is changed or when transmission is changed to reception and vice versa.

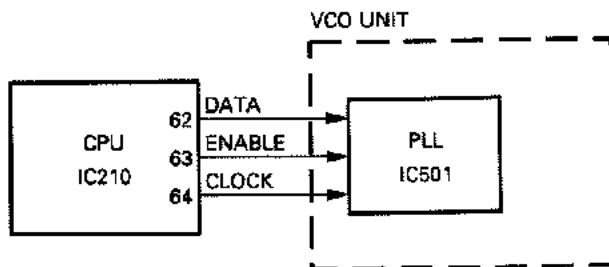

Fig. 11 PLL data output block diagram

**6-5. Tone generator**

The beeps and alert tones are generated by combining square wave signals of about 700Hz, 900Hz, and 1500Hz generated by the CPU. These signals are output from pins 34, 35, and 36 of the CPU (IC210). The signals are rectified by a CR network and fed to the deemphasis circuit of IC215 (2/2).

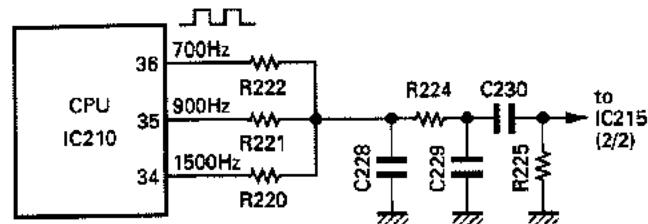

Fig. 12 Tone generator circuit

**6-6. Power switch circuit**

The power switch consists of a D-type flip-flop (IC201), DC switch (Q201), and its peripheral circuits. When the power key on the display section is pressed, the PSW goes low, and enters IC201. Q201 turns on and power is supplied (SB). This circuit toggles the momentary-type power switch.

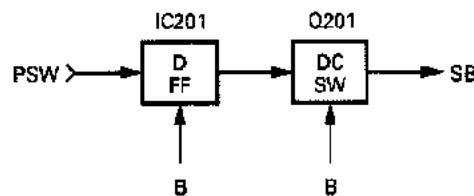

Fig. 13 Power switch block diagram

**6-7. Display circuit**

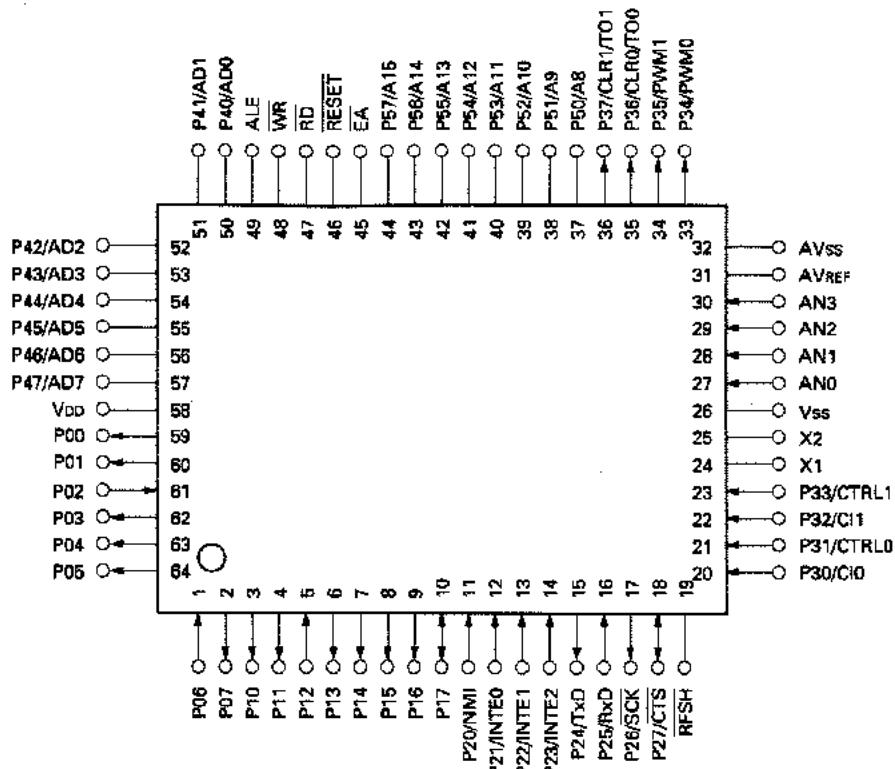

The display circuit consists of the CPU, LCD, and peripheral circuits. The CPU (IC401) mainly controls the following functions:

- 1) Transmitting the on/off serial data signal from the system switch, group switch, lamp switch, SCAN switch, and A (AUX) switch to the control unit
- 2) Receiving the serial data signal from the control unit and displaying the data on the LCD. The LCD contains the 13-segment display (system, group), and BUSY, CALL, SCAN, and AUX indicators. Controls the LEDs (TX, LAMP).

## VCO (X58-4000-11)

Ref. No.	Parts No.	Use/Function	Operation/Condition
IC501	MB1512PPV-G-BND	PLL system	
Q501	2SA1586(T,GR)	DC amplifier	
Q503	2SC4095(R47)	Buffer amplifier	
Q504	2SC4226(R24)	Buffer amplifier	
D501	1SS300		

## SIGNALING UNIT (X52-3260-20) : Option (KDM-6)

Ref. No.	Parts No.	Use/Function	Operation/Condition
IC1	TC4S584F	Schmitt inverter	
IC2	TC7S00F	Nand gate	
IC3	LR40872	Tone dialer	
Q1	2SA1162(Y)	DC switch	
Q2	2SC2712(GR)	DC switch	
Q3	2SA1162(Y)	DC switch	
Q4	2SC2712(GR)	DC switch	
D1~12	B30-2050-05	LED	Yellow
D13	DAP202K	Current steering

## ADJUSTMENT

### Test Equipment Required for Alignment

No.	Test Equipment	Major Specifications
1	Standard Signal Generator (SSG)	Frequency Range Modulation Output 800 to 950MHz or more. Frequency modulation and external modulation. 0.1µV to greater than 1mV.
2	Power Meter	Input Impedance Operation Frequency Measurement Capability 50Ω. 800 to 950MHz or more. Vicinity of 10W.
3	Deviation Meter	Frequency Range 800 to 950MHz.
4	Digital Volt Meter (DVM)	Measuring Range Accuracy 1 to 10V DC. High input impedance for minimum circuit loading. DC through 30MHz.
5	Oscilloscope	
6	High Sensitivity Frequency Counter	Frequency Range Frequency Stability 10Hz to 1000MHz. 0.2ppm or less.
7	Ammeter	5A.
8	AF Volt Meter (AFVTVM)	Frequency Range Voltage Range 50Hz to 10kHz. 3mV to 3V.
9	Audio Generator (AG)	Frequency Range Output 50Hz to 5kHz or more. 0 to 1V.
10	Distortion Meter	Capability Input Level 3% or less at 1kHz. 50mV to 10Vrms.
11	Voltmeter	Measuring Range Input Impedance 10 to 1.5V DC or less. 50kΩ/V or greater.
12	8Ω Dummy Load	Approx. 8Ω, 3W.
13	Regulated Power Supply	7.5V, approx. 5A (adjustable from 6 to 9V). Useful if ammeter equipped.

### The following parts are required for adjustment:

#### Antenna connector adapter

The antenna connector of this radio uses an SMA terminal.

Use an antenna connector adapter [SMA(f) – BNC(f) or SMA(f) – N(f)] for adjustment. (The adapter is not provided as an option, so buy a commercially-available one.)

#### DC cable

Use the optional DC cable (PG-2W).

# ADJUSTMENT

## Test Mode

The set has been adjusted for the frequencies shown in the following table.

When required, re-adjust them following the adjustment procedure to obtain the frequencies you want in actual operation.

		GRP1	GRP2	GRP3	GRP4	GRP5	GRP6	GRP7	GRP8	GRP9

TEST MODE operating features : See next page.

## ADJUSTMENT

**Test Mode Operating Features**

This transceiver has a test mode. To enter test mode, insert a 2.5mm stereo plug into the external speaker socket and switch the power on. Test mode can be inhibited by programming. To exit test mode, remove the stereo plug or insert a mono plug (some diameter) and switch the power on again. The following functions are available in test mode:

• **System key**

The system key is used to select up to 16 programmed test frequencies. Test frequencies are set by programming.

If no system has frequency data, the main program writes default values.

• **Group key**

The following modulation signals or squelch type can be selected with the group key:

Group	Modulation	Squelch type	Power
1	No modulation	Carrier	Hi
2	100Hz square wave	Carrier	Hi
3	LTR format data	LTR format data	Hi
4	QT (103.5Hz) tone	QT 103.5Hz	Hi
5	QT (100Hz) tone	QT 100Hz	Hi
6	DQT (065N) code	DQT 065N	Hi
7	EOS (HSD)	EOS (HSD)	Hi
8	EOS (HSD)	EOS (HSD)	LOW
9	No modulation	Carrier	LOW

• **A key**

If the A key is pressed in the test mode, transmitter enters talk-around mode to transmit with the receive frequency. The dot (•) at the lower left of the system indicator lights.

• **S key**

If the S key is pressed in test mode, a scan operation is performed. The system indicator shows a dash (-). All programmed test frequencies are scanned.

• **Monitor key**

If this key is pressed in test mode, the squelch is turned off. If there is no signal, noise is output from the speaker.

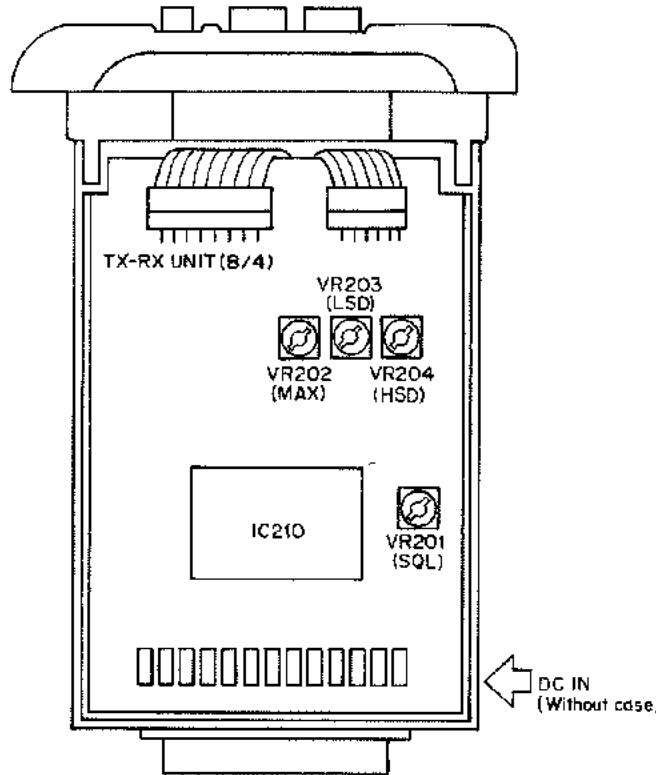

• **Transmitter**

The transmitter is keyed using the microphone PTT button. The modulation signal selected with the group key is transmitted.

Dimension (Body only)

7.87" (200mm) W x 5.28" (134mm) D x 3.35" (85mm) H

## KSC-7 Circuit Description

## 1. General

The KSC-7 is a rapid charger for the KNB-5, KNB-6, KNB-7 and KNB-9A Ni-Cd batteries.

## 2. Theory of operation

The operation of each block is explained below.

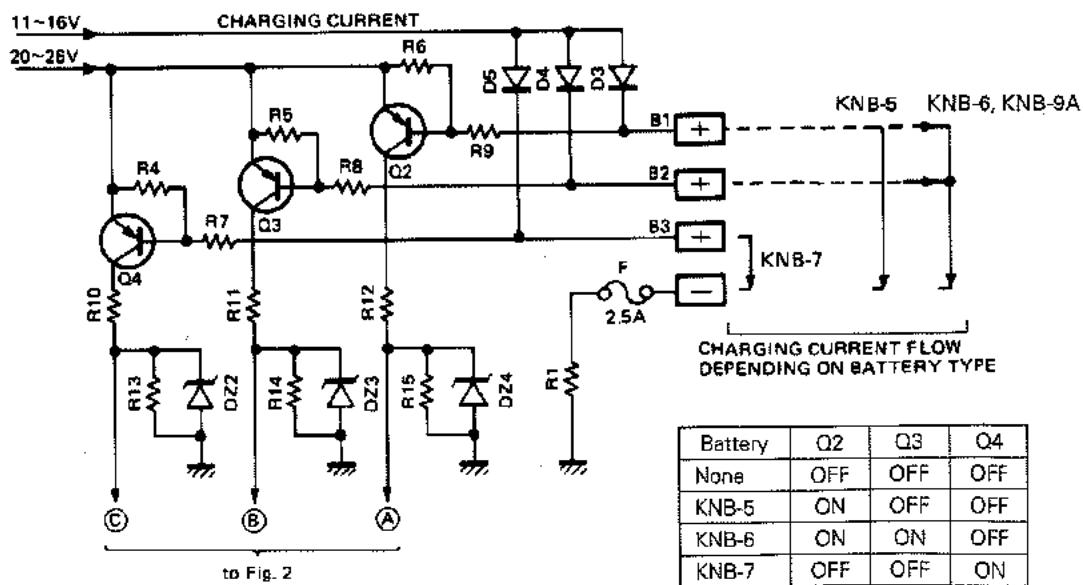

## • +11V AVR circuit

This AVR circuit, consisting of a 2SD600F transistor (Q1) and GZA11Y Zener diode (DZ1) provides an output of approximately +11V as the reference voltage for the charging circuit consisting of IC2 to IC5.

## • Battery pack detect circuit

This circuit detects whether a battery pack is inserted in the charger. Outputs from this circuit are routed to the reset circuit and the battery recognition circuit.

When a KNB-5 is inserted in the charger, a small amount of current flows from Q2 : 2SA608E through R9 to the charging terminal B1 and Q2 turns on. As a result, an output of approximately 11V appears at (A) in Fig. 1. Similarly when a KNB-6 or KNB-9A is inserted Q3 : 2SA608E turns on and approximately 11V is provided at output (B). When a KNB-7 is inserted Q4 : 2SA608E turns on and approximately 11V is provided at output (C).

Battery	Q2	Q3	Q4
None	OFF	OFF	OFF
KNB-5	ON	OFF	OFF
KNB-6	ON	ON	OFF
KNB-7	OFF	OFF	ON
KNB-9A	ON	ON	OFF

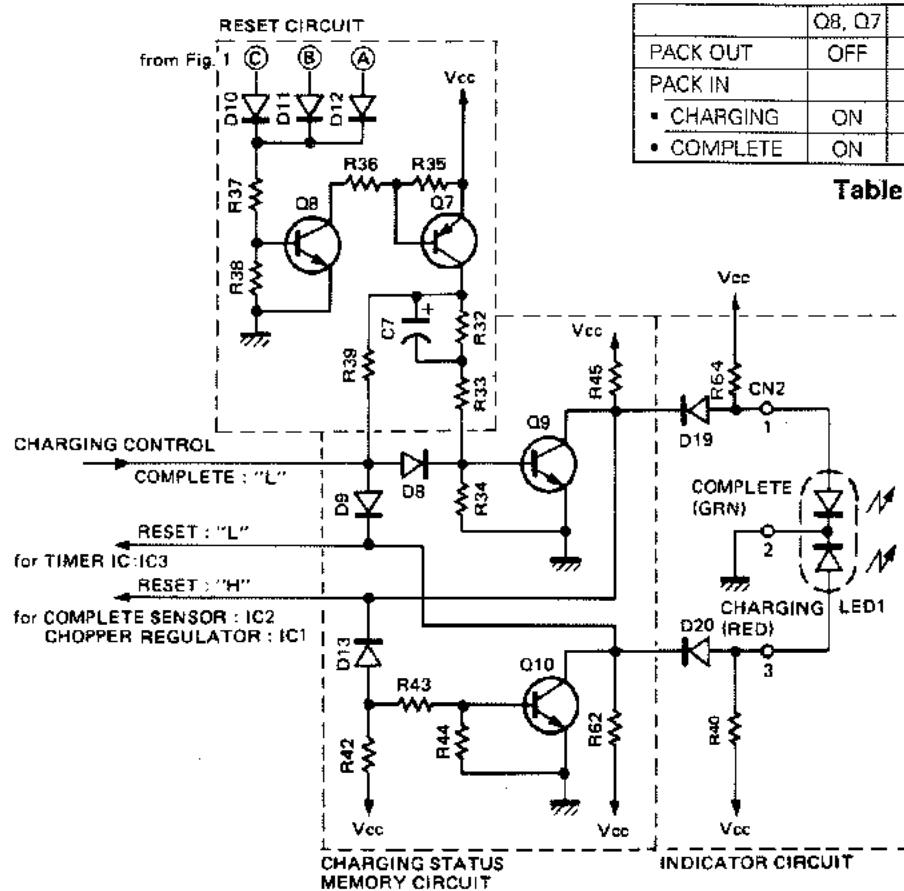

Table 1

Fig. 1 Battery pack detect circuit block diagram

# KSC-7 (RAPID CHARGER)

- Reset, Charge status memory and display circuit**

The reset circuit initializes the charging status memory circuit.

	Q8, Q7	Q9	Q10	LED1
PACK OUT	OFF	OFF	ON	-
PACK IN				
▪ CHARGING	ON	ON	OFF	RED
▪ COMPLETE	ON	OFF	ON	GRN

Table 2

Fig. 2 Reset circuit/Charge status memory circuit/Display circuit block diagram

The charge status memory circuit is an R-S flip-flop configured from transistors and resistors. The two states of the flip-flop are called COMPLETE and CHARGING. Outputs from the flip-flop drive the LED in the indicator circuit and reset the timer, complete sensor, and chopper regulator. In the COMPLETE state Q9 : 2SC536E is off and Q10 : 2SC536E is on. In the CHARGING state Q9 is on and Q10 is off.

When a battery pack is not inserted, Q8 : 2SC536E and Q7 : 2SC536E turn off. As there is no base voltage to Q9, Q9 also turns off. The base of Q10 receives enough bias from Vcc to turn on, resulting in 0V at the collector. The current flow through R41 to the CHARGING indicator in LED1 which glows red, because of Q9 is off.

When the battery pack is inserted Q8 and Q7 turn on. As soon as Q7 turns on, charging current flows through R33, R34, and Q9 to C7 and Q9 turns on. The base voltage of Q10, which is connected to Q9 through diode D13, then drops and Q10 turns off. Since Q10 is off, current flows through R40 to the CHARGING indicator in LED1, which glows red to indicate that the battery is charging. When charging of C7 is completed, on-current continues to flow to the base of Q9 through R39 and D8.

When charging is completed the complete sensor (IC2) outputs a low ("L") signal that ends the flow of current to the base of Q9, turning Q9 off. As a result current flows through R64 to the COMPLETE indicator in LED1, which glows green to indicate that charging is complete.

## KSC-7 (RAPID CHARGER)

## • Battery recognition circuit

The battery recognition circuit uses NAND logic to recognize the battery type from the outputs from the battery pack detect circuit. Outputs from this circuit are sent to the charging current limiting circuit and sensor level switching circuit.

	INPUT		OUTPUT		
	A	B	D	F	G
KNB-5	H	L	H	L	H
KNB-6	H	H	L	L	H
KNB-7	L	L	H	L	L
KNB-9A	H	H	L	L	H

Table 3

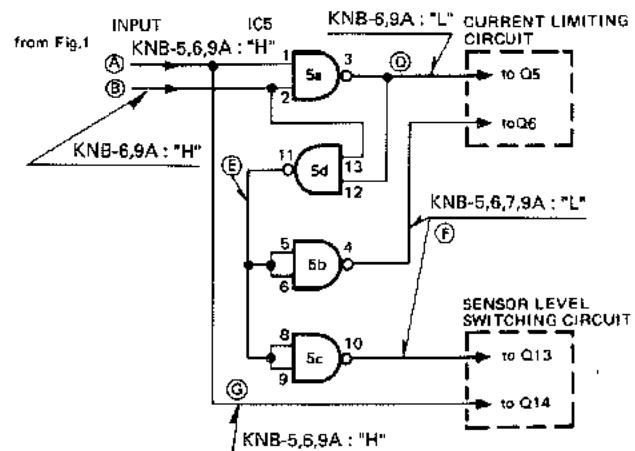

Fig. 3 Battery recognition circuit block diagram

## • Charging current limiting circuit

This circuit receives the output of the battery recognition circuit and limits the charging current according to the type (current capacity) of battery. The charging current ICR is detected as a voltage drop across R1 ( $0.15\Omega$ ), which is provided to pin 3 of the operational amplifier IC4 (1/2) : LA6393S. Pin 4 receives a reference voltage (VREF) used as a comparison standard for limiting the charging current. The VREF is charged by ON and OFF of Q5 and Q6 (See Table 4).

Pin 2 of IC4 : LA6393S provides "L" output when  $V_{REF} < V_{CR}$ , stopping the operation of the chopper regulator (IC1 : STK772B) and reducing the charging current. The charging current is limited by the formula :

$$ICR \text{ MAX (A)} = V_{REF} (\text{V}) / 0.15 (\Omega)$$

	Q5	Q6	VREF	ICR MAX
KNB-5	OFF	OFF	0.25V	1.7A
KNB-6	ON	OFF	0.36V	2.4A
KNB-7	OFF	OFF	0.25V	1.7A
KNB-9A	ON	OFF	0.36V	2.4A

Table 4

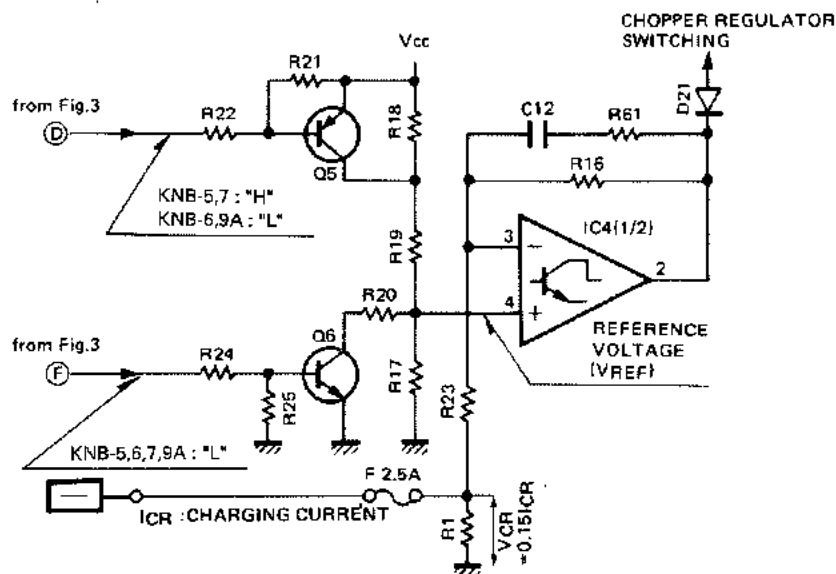

Fig. 4 Charging current limiting circuit block diagram

# KSC-7 (RAPID CHARGER)

## Sensor level switching circuit

This circuit receives the output of the battery recognition circuit and aligns the voltage supplied to the charging status detect circuit according to the battery type (voltage) so that they are nearly equal at completion of charging.

	SHIFT Es (V)	Q11	Q12
KNB-5	2.0	OFF	ON
KNB-6	2.0	OFF	ON
KNB-7	7.6	OFF	OFF
KNB-9A	2.0	OFF	ON

Table 5

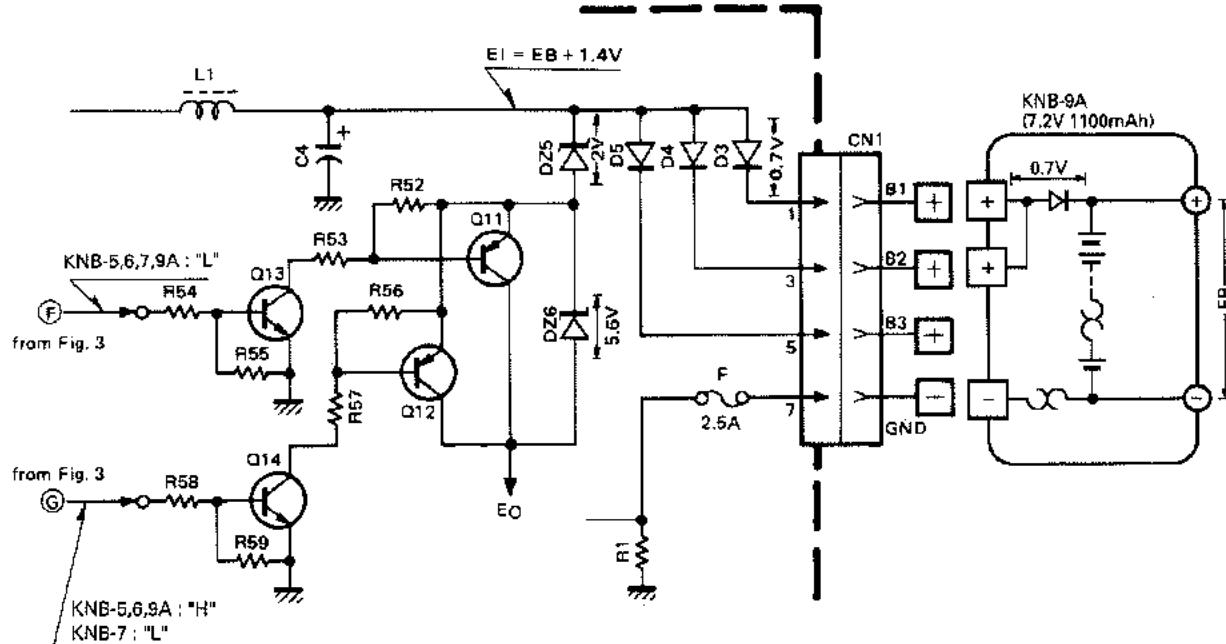

Fig. 5 Sensor level switching circuit block diagram

The pin voltages while the Ni-Cd battery is charging are approximately 1.2 times the voltages at the completion of charging (See Figure 6).

The battery terminal voltage EB is as follows :

Approximately 14.4V for the KNB-7

Approximately 8.6V for the KNB-5, 6, 9A

The charging line voltage EI is the EB voltage plus a 1.4V voltage drop added by a diode.

$$EI = EB + 1.4V \dots \dots \dots (1)$$

The EI voltage is output with a level shift as the voltage EO to the charging status detect circuit via Zener diode DZ6 and diodes D17 and D18. The amount of the shift is controlled by switching Q11 : 2SA608E and Q12 : 2SA608E on and off (See Table 5). If Eq. (1) is substituted into EO in Table 5, the results are :

$$\text{KNB-5, 6, 9A} : EO = EB - 6.2V$$

$$\text{KNB-7} : EO = EB - 0.6V$$

At the completion of charging the value is approximately 8V.

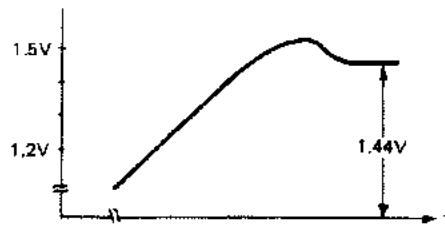

Fig. 6 The pin voltages while the Ni-Cd battery is charging

# KSC-7 (RAPID CHARGER)

## • Charging status detect circuit

This circuit detects the completion of charging and outputs a signal to stop charging. When no battery pack is inserted or charging is completed, a High ("H") Reset signal is applied to D15. When a battery is inserted the Reset signal applied to D15 is cleared. When the Reset signal is cleared, pin 4 of IC2 : KCH-1003 holds the reset state due to the charge in C8 for the duration of the R46 and C8 time constant, then goes "L" to clear the reset state. Pins 8 and 9 of IC2 receive divided portions of the battery voltage.

These inputs are tracked as the charging is performed in the long-term memory capacitor "MD". As the Ni-Cd battery charges, the battery voltage reaches a peak, then declines (See Figure 6). The MD stores the peak voltage, which is compared with the divided voltages at pins 8 and 9. When the difference  $\Delta V$  is the same, a "L" signal is output from pin 11 to indicate that charging is complete. The signal indicating completion of charging is applied to the charging status memory circuit.

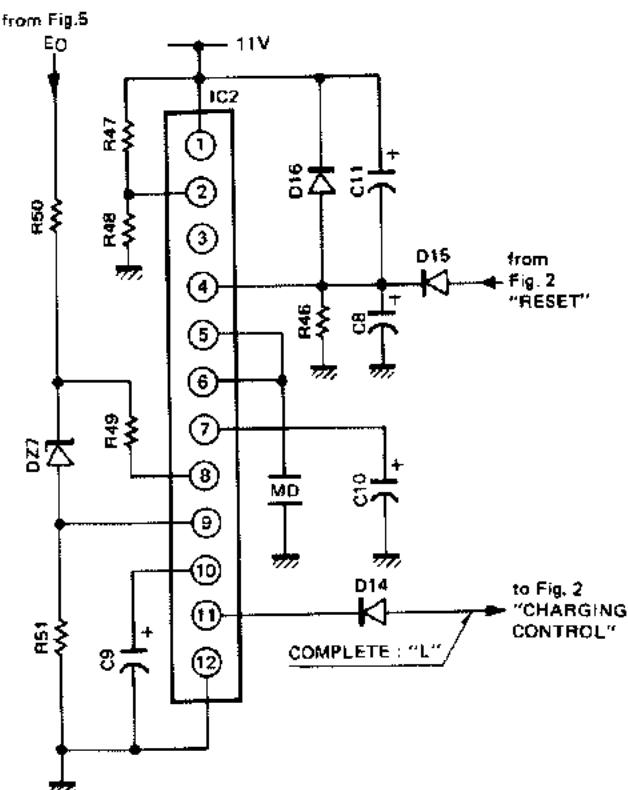

Fig. 7 Charging status detect circuit block diagram

## • Timer circuit

Battery defects may result in charging continuing indefinitely without completion, so this timer outputs a signal that stops charging approximately 1.7 hours after charging begins. When charging begins and the Reset signal is cleared at pin 3, IC3 : AN6780 begins counting. At the first count of 16384 pin 6 goes from "H" to "L".

The output from pin 6 is connected to the Stop input (pin 2), so the output of IC3 is held in the "L" state until IC3 receives another Reset signal (for example, when the battery is removed).

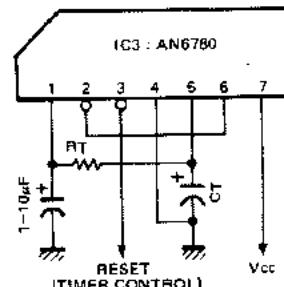

Fig. 8 Timer circuit block diagram

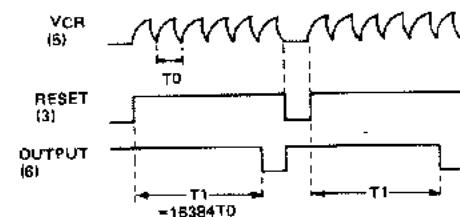

Fig. 9

## • Voltage comparator circuit

This circuit monitors the output (EO) of the sensor level switching circuit and indirectly detects abnormal conditions in the battery pack connected to the charging terminal. When the EO voltage falls to 5.2V or lower, the charging control line goes "L" to halt charging.

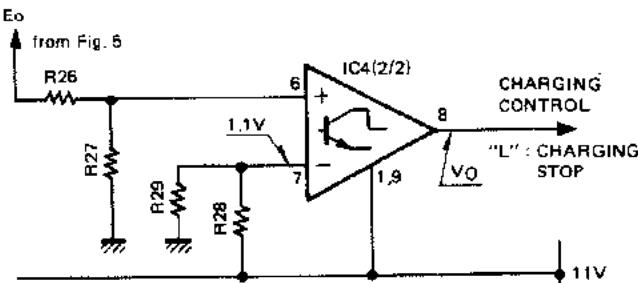

Fig. 10 Voltage comparator circuit block diagram

## SPECIFICATIONS

### GENERAL

#### Frequency Range

RX ..... 935 to 941MHz  
TX ..... 896 to 902MHz (935 to 941MHz : Talk-Around)

Systems ..... 16 systems

Groups ..... 10 groups

Channels ..... 20 channels per system (Trunked)  
10 channels per system (Conventional)

Channel Spacing ..... 12.5kHz (PLL channel step 12.5kHz)

Battery Voltage ..... DC 7.5V

Battery Life ..... More than 8 hours at 5-5-90 duty cycle with KNB-9A battery

Temperature Range ..... -30°C to +60°C (-22°F to +140°F)

#### Dimensions and Weight

With KNB-9A (1100mAh battery) ..... 7.20" (183mm) H x 2.44" (62mm) W x 1.34" (34mm) D, 1.21lbs (550g)

### RECEIVER

(Measurements made per EIA standard EIA-316-B)

RF Input Impedance ..... 50Ω

#### Sensitivity

EIA 12dB SINAD ..... 0.35µV

Modulation Acceptance ..... ±3.5kHz

Selectivity ..... -63dB

Intermodulation ..... -60dB

Spurious (Except for IF1/2) ..... -70dB

Frequency Stability ..... ±0.00015% (-30°C to +60°C)

Frequency Spread ..... 6MHz

Audio Power Output ..... 500mW at less than 5%/8Ω distortion

### TRANSMITTER

(Measurements made per EIA standard EIA-316-B)

RF Power Output

High ..... 2.5W (Except for Talk-Around)

Low ..... 1W

RF Output Impedance ..... 50Ω

Spurious ..... -60dB

Modulation ..... 11K0F3E, 11K0F1D, 10K5F2D

FM Noise ..... -40dB

Audio Distortion ..... 5.0% at 0.3 to 3kHz

Frequency Stability ..... ±0.00015% (-30°C to +60°C)

Frequency Spread ..... 45MHz

## KENWOOD CORPORATION

Alve Mitake, 2-5, Shibuya 1-chome, Shibuya-ku, Tokyo 150, Japan
