TM-461A

CIRCUIT DESCRIPTION

CIRCUIT CONFIGURATION BY FREQUENCY

The TM-461A incorporates a PLL synthesizer which uses a digital VFO to allow any channel step of 5, 10, 12.5, 15, 20 or 25kHz to be selected (See Figure 1).

The receiving system utilizes double-conversion techniques. That is, an incoming signal is mixed down to the 1st intermediate frequency (IF) of 30.300MHz (C1), 30.825MHz (K,M2), 34.300MHz (C2), using a 1st local oscillator frequency of from 369.700 to 399.695MHz (C1), 369.175 to 439.170MHz (K,M2),

415.700 to 435.695MHz (C2). The 1st IF signal is then mixed with the 2nd local oscillator frequency of 30.755MHz (C1), 30.370MHz (K,M), 33.845MHz (C2) to generate the 2nd IF of 455kHz.

The transmitting system consists of a PLL circuit which allows direct modulation and direct frequency division. Signals from the PLL circuit are amplified by a linear amplifier for transmission.

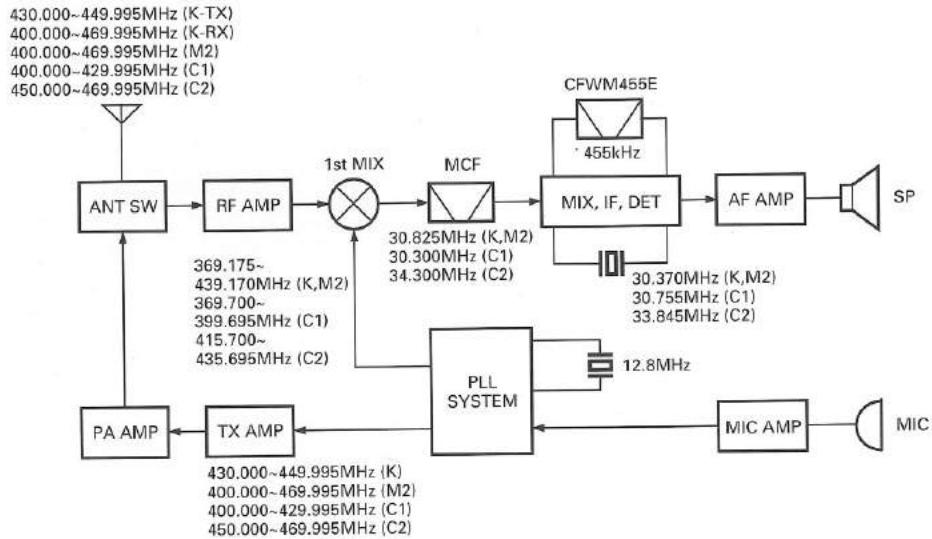

Fig. 1 Frequency configuration

RECEIVING SYSTEM

• Overview

Incoming signals from the antenna pass through a low-pass filter in the transmitters final stage, then through the transmit/receive switching diode, and then to the front end of the receiver.

The incoming signals are amplified by a GaAs FET and enter a two-pole helical resonator. The signals are then passed through an additional two-pole helical resonator in order to remove any remaining undesirable components, and is fed to the 1st mixer. The 1st mixer uses the GaAs FET (Q3) that are used in the RF stage to obtain better two-signal characteristics. The 1st mixer mixes the signal with the 1st local oscillator frequency and converts it to the 1st IF (30.300MHz (C1), 30.825MHz (K,M2), 34.300MHz (C2)). The signal then passes through two-stage MCF (monolithic crystal filters) to remove unnecessary near-by frequency components.

The signal from the MCF is used as the 1st IF signal.

The 1st IF signal is amplified and fed into IC1 (KCD10) in the FM IF HIC. The IF signal is then mixed with the 2nd local oscillator frequency of 30.370MHz (K,M2), 30.775MHz (C1), 33.845MHz (C2) to generate the 2nd If of 455kHz. The 455kHz signal is then passed through a six element ceramic filter (CFWM455E), and fed back into IC1 for additional amplification. The output signal from the IC1 is then fed into a power amplifier via the audio volume control for application to the speaker.

• S-meter circuit

S-meter control voltage from IC1 (KCD10) in the FM IF HIC is fed into the control unit. The CPU converts the voltage from an analog to digital signal in order to operate the LCD bar meter.

CIRCUIT DESCRIPTION

Item	Rating
Nominal center frequency (fo)	30.300MHz
Pass bandwidth	$\pm 7.5\text{kHz}$ or more at 3dB
Attenuation bandwidth	$\pm 28\text{kHz}$ or less at 40dB
Ripple	1.5dB or less
Insertion loss	3.0dB or less
Guaranteed attenuation	60dB or more within $\pm 1\text{MHz}$ (Spurious 40dB or more)
Terminating impedance	1.2k Ω /0.5pF

TRANSMITTING SYSTEM

- **Overview**

The transmitter produces the target frequency thru the use of direct FM-modulation via a vari-cap diode.

- **Modulation circuit**

Voice signals from the microphone are fed into the microphone amplifier circuit of the control unit for amplification by the 1st transistor amplifier, and then into two operational amplifiers. These operational amplifier perform pre-emphasis, amplification, limiting, and includes a splatter filter, which is used to reduce undesirable high-frequency components from the signal. This signal is into the VCO of TX-RX unit.

The FM modulation circuit applies this signal directly to the VCO via a vari-cap diode.

- **Younger-stage circuit**

Signals from the VCO are applied to the drive HIC IC6 (KCB14). The amplifier always operates in a linear mode so that signals can be amplified without degradation. Additionally the amplifier is designed to cover a wide range of frequencies and can produce stable output without adjustment. The APC (Automatic Power Control) controls collector voltage from the last stage of the younger-stage circuit.

- **Power amplifier circuit**

The drive signal is amplified to the required level by the power module. The TM-461A uses a large heat sink to prevent failure of the final amplifier due to temperature. It is provide efficient radiation of the heat generated by the final amplifier.

- **APC circuit (Automatic Power Control)**

The automatic power control circuit (APC) uses a diode to detect a portion of the output from the final module, It amplifies this signal and uses it as a control voltage, this control voltage is inversely proportion to the output so that a constant output is produced.

TM-461A

CIRCUIT DESCRIPTION

PLL SYNTHESIZER UNIT

A block diagram of the PLL and VCO unit is provided in Figure 3. In the TM-461A, the PLL system is implemented as a sub-unit which is divided into the upper VCO and lower PLL blocks. The sub-unit is shielded to prevent external interference.

There are two reference frequencies, 6.25kHz and 5kHz, available to allow 5,10,12.5,15,20,25kHz-step operation. The 6.25kHz is obtained by dividing the reference oscillator frequency of 12.8MHz by 1/2048, and the 5kHz is obtained by dividing it by 1/2560. The VCO directly generates the dial frequency. This dial frequency is amplified once and then fed into a pulse swallow-type PLL IC for frequency division and phase comparison, in order to lock the frequency.

The PLL system is locked without switching between transmit mode and receive mode. By using a signal ("H" in transmit mode) from pin 10 of the PLL IC (M54959FP), the LPF is deactivated-activated by Q4 only for the moment when the TM-461A enters transmit mode. This helps produce lock more rapidly than previous methods.

• Calculate example

$f_{vco} (\text{RX})$ is calculated by the following formula;

$$f_{vco} = \{ (n \times 128) + A \} \times f_{osc} + R$$

where,

f_{vco} : VCO output frequency

n : Binary value of the 10-bit programmable counter

A : Binary value of the 7-bit programmable counter

f_{osc} : 12.8MHz reference frequency

R : Binary value of the 14-bit programmable counter

2560 (When channel step is 5,10,15,20 or 25kHz)

2048 (When channel step is 12.5kHz)

• 8T (8V in transmit mode)/8R (8V in receive mode) switching and unlock circuits

In receive mode, the base of Q9,Q12 has 0.7V. As a result, Q9,Q12 is on, and Q10 and Q8 are off, then the collector of Q7 (8R) provides voltage, and the collector of Q8 (8T) provides no voltage

The CPU output serial data to shift register IC3 when the PTT switch is depressed. As a result, pin 13 of IC3 becomes "L", turning Q12 off, and Q10 and Q8 on. The 8T line is therefore supplied with 8V.

The unlock protect circuit operates only in transmit mode. Q11 is a PLL unlocking switching transistor. Usually, the base of Q11 is supplied with 0V ("L"), and the collector is supplied with 8V ("H").

When the PLL is unlocked, the base of Q11 is supplied with 0.7V, turning Q11 on. As a result, the collector of Q11 becomes "L" (0V). This turns Q10 off and the collector of Q8 becomes 8V, turning it off. Therefore, when the PLL is unlocked, Q8 is off removing bias voltage from the 8T line. Without the 8T voltage no transmit signal is generated.

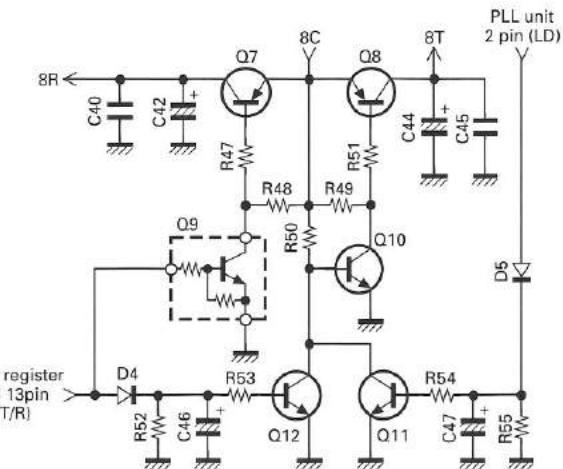

Fig. 4 8T/8R switching and unlock circuits

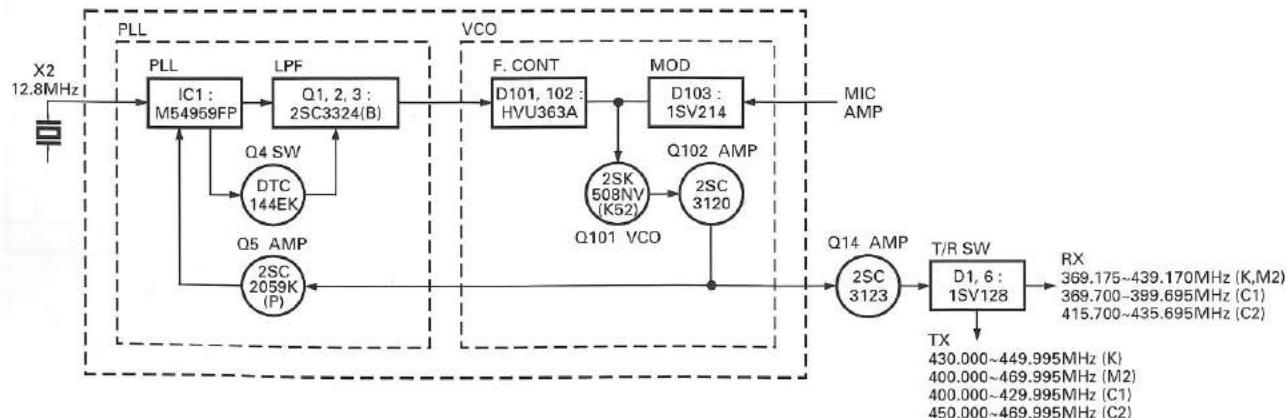

Fig. 3 PLL block diagram

CIRCUIT DESCRIPTION

DIGITAL CONTROL UNIT

• Overview

The digital control unit consists of several keys, a rotary encoder input, a lamp switching circuit, a reset circuit, and a back-up circuit. These circuits are controlled by a single microprocessor (CPU).

The LCD drive and a tone output is carried by CPU.

• Key and rotary encoder input circuits

The keys (on the panel) input and output from the rotary encoder is fed directly into the CPU.

• Microphone key input circuit

The UP, DOWN, and other function keys of the microphone are directly connected to their corresponding analog input pins of the CPU. Each of the functions is activated by a voltage generated when the corresponding key is pressed.

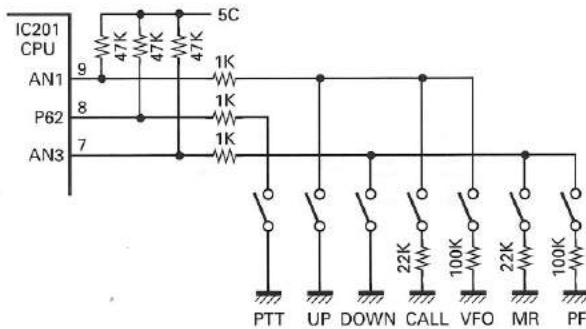

Fig. 5 Microphone key input circuit

• Reset and back-up circuits

When the TM-461A power is turned on, the reset circuit sends a "L" level pulse to the RESET pin of the CPU. This initiates the power-on reset sequence.

When the TM-461A power is turned off, the back-up circuit detects a voltage drop in the SB line and sets the CPU INT0 (BCHK) to a "H" level. This causes the CPU to enter a back-up state and then back-up data is transmitting to the EEPROM (IC210 : X25160SI-2.7).

• Microprocessor and EEPROM

The microprocessor (IC201) and the EEPROM (IC210 : X25160SI-2.7) is connected three line system of data input and output. The data forward with Serial-data type. The port P17 and P20 of the microprocessor are directly connected to SI and SO port of the EEPROM.

• Lamp switch circuit

The lamp switch circuit is switched by the constant voltage of 8V from 8C with Q201 and Q202. The lamp switch circuit is turning ON and OFF to LCD back-lamp. R201 is always supply the idle-current to the lamps, it on account of prevent an over-current from flowing through the lamp.

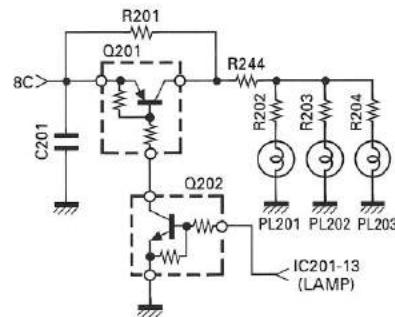

Fig. 7 Lamp switch circuit

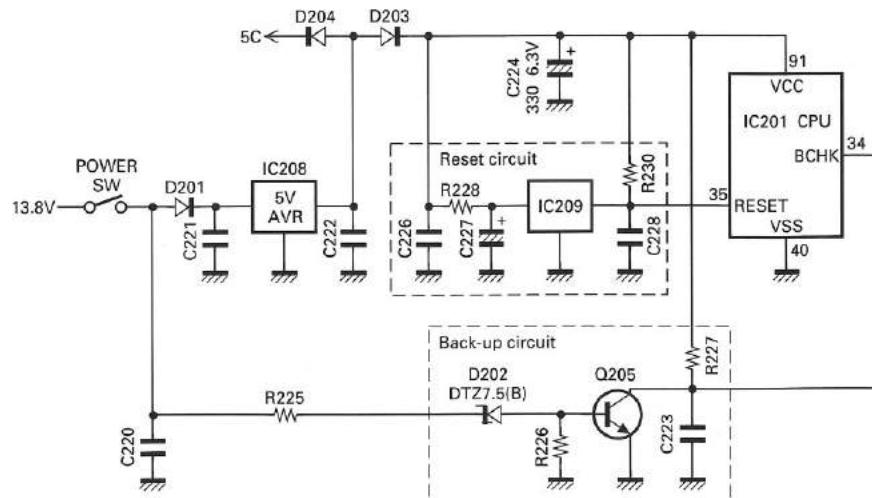

Fig. 6 Reset and back-up circuits

CIRCUIT DESCRIPTION

- PLL data output**

PLL data is available from P47 (CK), P46 (DT), and P50 (EP1) of the CPU. Figure 8 is a timing chart for PLL data transfer, and Figure 9 shows the format of PLL data.

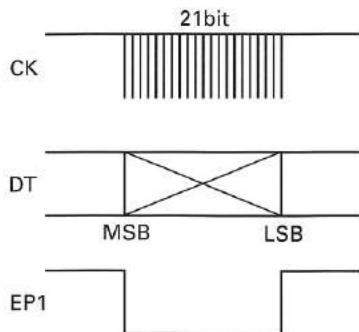

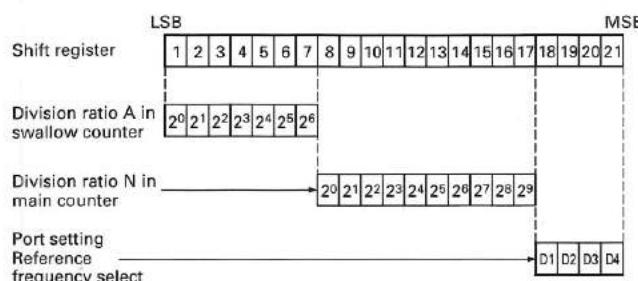

Fig. 8 Timing chart for PLL data transfer

The 21-bit data is made up of the following:

- Division ratio data A and N (17bits)
F (Display – 30.300MHz (C1) or 30.825MHz (K,M2) or
34.300MHz (C2) in RX mode)
 $= \{(N \times 128) + A\} \times \text{ref}$
N : Division ratio set in 10-bit main counter (binary)
A : Division ratio set in 7-bit swallow counter (binary)

- Reference frequency (ref) select (2bits)

Data		Phase reference frequency		
D1	D2			
L	L	5kHz		5,10,15,20,25kHz step mode
H	H	6.25kHz		12.5kHz step mode

- Switch select (2 bit)

Data		Output port		
D3	D4	SW1	SW2	
L	H	L	H	RX mode
H	L	H	L	TX mode

Fig. 9 PLL data format

- Shift register circuit**

The shift register circuit consists of IC3 (BU2090FS). The IC3 receives serial data from the microprocessor to perform the controls listed below.

Pin No.	Pin name	Function
1	Vss	GND
2	DATA	Serial data input.
3	CLOCK	Clock input.
4	-	Not used.
5	-	Not used.
6	-	Not used.
7	-	Not used.
8	-	Not used.
9	-	Not used.
10	TXM	TX power select. "H" in MID mode, "L" in HI or LOW mode.
11	TXH	TX power select. "H" in HI mode, "L" in MID or LOW mode.
12	-	Not used.
13	T/R	Transmit/receive select. "H" in RX mode, "L" in TX mode.
14	MUTE	AF mute. "H" when TX mode, CTCSS or squelch is on.
15	-	Not used.
16	Vdd	5V

Table 7

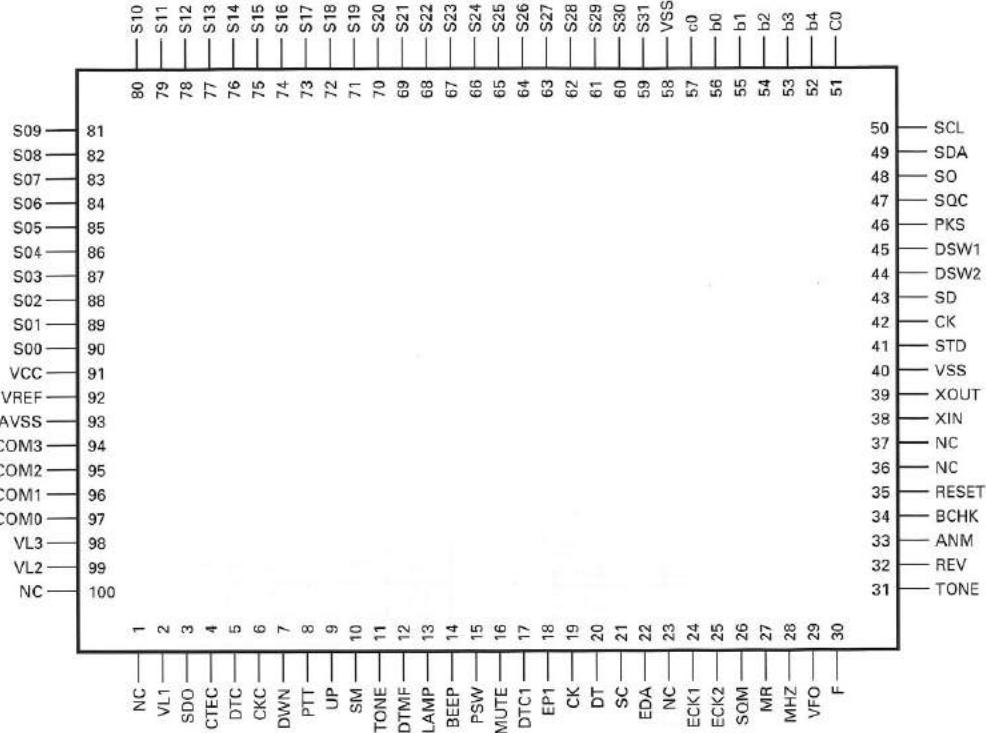

- Input and output of CTCSS unit (option)**

The optional CTCSS unit receives data from P64, P65, and P66 of the CPU. When a tone from the CTCSS unit is detected, a "H" level signal is sent to P67 of the CPU, opening the squelch.

PACKING

ADJUSTMENT

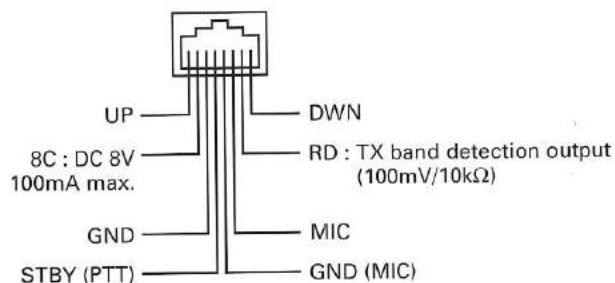

Measuring Equipment for Adjustment

1. Tester
Input impedance: High
2. RF valve voltmeter (RF V.M)
Input impedance: $1M\Omega$ or more, $2pF$ or less
Voltage range: Full scale = $10mV$ to $300V$
Measurable frequency range: Up to $450MHz$
3. Frequency counter (f. counter)
Input sensitivity: About $50mV$
Measurable frequency: $450MHz$ or more
4. DC power supply
Voltage: Variable in the range 10 to $17V$
Current: $13A$ or more
5. Power meter
Measurement power: $60W$, $3W$, $1W$
Impedance: 50Ω
Measurable frequency: $450MHz$
6. AF valve voltmeter (AF V.M)
Input range: Full scale = $1mV$ to $30V$
Measurable frequency range: $50Hz$ to $10kHz$
7. AF generator (AG)
Output frequency: $100Hz$ to $10kHz$
Output voltage: $0.5mV$ to $1V$
8. Line detector
Measurable frequency: $450MHz$
9. Spectrum analyzer
Measurable frequency: $450MHz$
10. Directional coupler
11. Oscilloscope
High sensitivity with horizontal input terminal
12. Standard signal generator (SSG)
The standard signal generator must be able to generate the 144 and $430MHz$ band frequencies and vary the amplitude and frequency.
Output: -20 to $100dB\mu$
13. Dummy load
 8Ω about $5W$
14. Noise generator
The noise generator must be able to generate noise similar to ignition noise containing high-frequency components of $450MHz$ or more.
15. Sweep generator
The sweep generator must be able to sweep the 144 and $430MHz$ bands.
16. Tracking generator

Preparation

- Set the controls and switches to the positions listed below unless otherwise specified.

VOL control	Fully counterclockwise
SQL control	Fully counterclockwise
POWER switch	OFF
DC power supply POWER switch (For fixed stations)	OFF

Microphone socket
(as viewed from the front of the set)

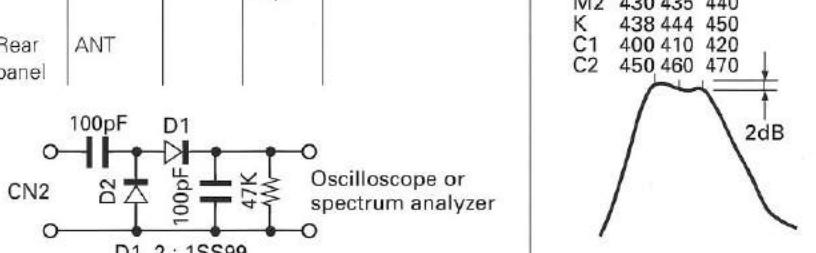

- Use an insulated rod, such as a plastic rod, for adjustment (especially for trimmers, coils, etc.).
- To protect the signal generator, never connect the microphone socket when the receiver section is adjusted.
- Before the power cord is connected, make sure the power switch is off.
- See the instruction manual for transmit and receive operations.

ADJUSTMENT

ADJUSTMENT

Adjustment Points

TC1, TC2, L3, L5 : Helical
TC3 : Transmission frequency
L9 : IF gain
VR2 : DEV
VR3 : HI power
VR4 : MID power
VR5 : S-meter

Jig (13 Pin Flat cable)

This is the same cable as TM-441's cable.

TERMINAL FUNCTION

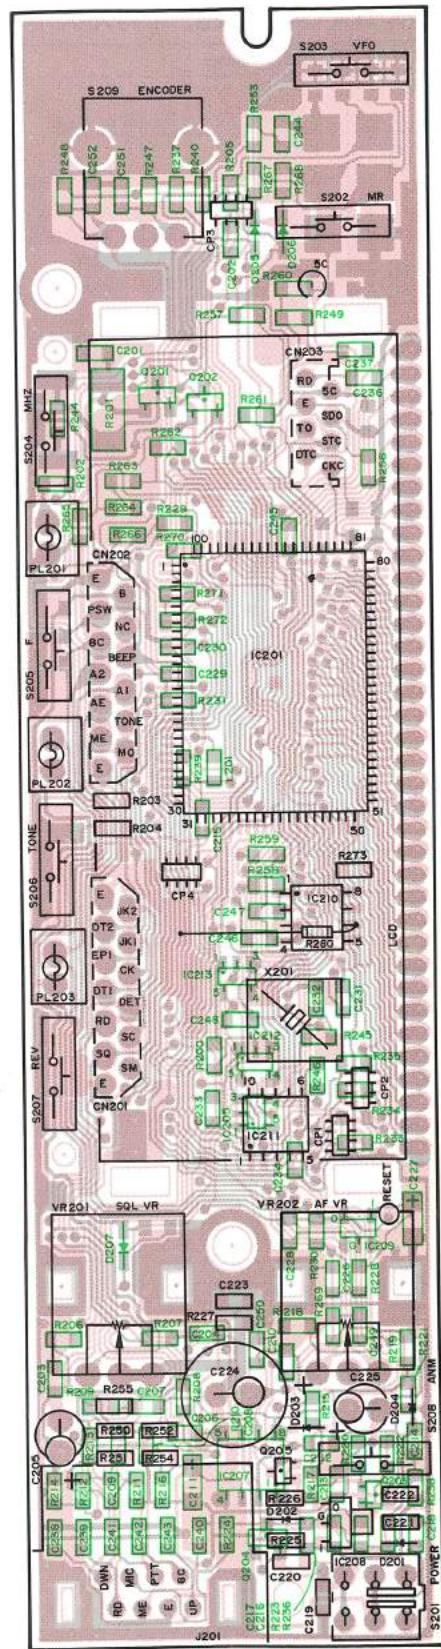

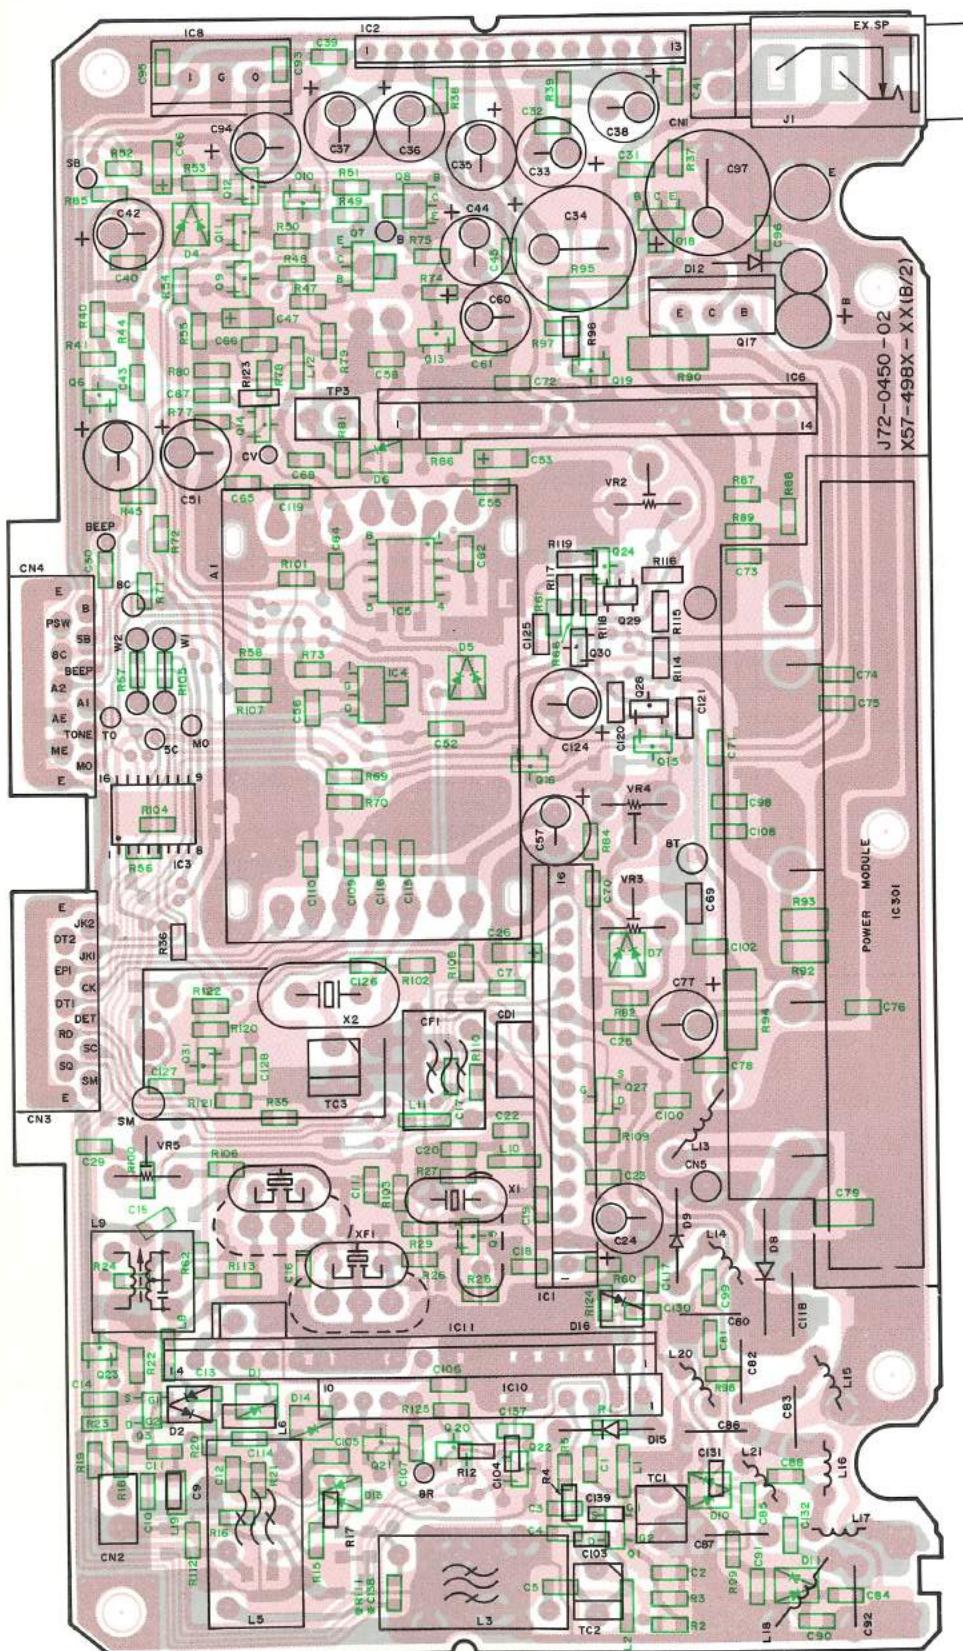

TX-RX Unit (X57-498X-XX)

CN No.	Pin No.	Name	Function
CN1	1	E	GND
	2	SP	Speaker input.
CN3	1	E	GND.
	2	JK2	Destination data output.
	3	DT2	Shift register (IC3) enable.
	4	JK1	Destination data output.
	5	EP1	PLL enable (From CPU IC201).
	6	CK	PLL clock (From CPU IC201).
	7	DT1	PLL data (From CPU IC201).
	8	DET	CTCSS detector output.
	9	RD	Audio input.
	10	SC	Squelch busy control input (To CPU IC201).
	11	SQ	Squelch output (To CPU IC201).
	12	SM	S-meter input (To CPU IC201).
	13	E	GND.
CN4	1	E	GND.
	2	B	+13.8V.
	3	PSW	Power switch control input.
	4	SB	+B line input from secondary terminal of power switch.
	5	8C	Common +8V.
	6	BEEP	Beep input (To audio IC from CPU).
	7	A2	Audio input (To AF power amplifier from AF volume).
	8	A1	Audio output (To AF volume).
	9	AE	GND.
	10	TONE	Tone input.
	11	ME	MIC GND.
	12	MO	Modulation input.
	13	E	GND.
CN201	1	E	GND.
	2	JK2	Destination data input.

CN No.	Pin No.	Name	Function
CN202	3	DT2	Shift register data output (From CPU IC201).
	4	JK1	Destination data input.
	5	EP1	PLL enable (From CPU IC201).
	6	CK	PLL clock (From CPU IC201).
	7	DT1	PLL data (From CPU IC201).
	8	DET	CTCSS detector output.
	9	RD	Audio input.
	10	SC	Squelch busy control input (To CPU IC201).
	11	SQ	Squelch input (To CPU IC201).
	12	SM	S-meter input (To CPU IC201).
	13	E	GND.
	1	E	GND.
	2	B	+13.8V.
	3	PSW	Power switch control output (From CPU IC201).
	4	SB	+B line input from secondary terminal of power switch.
	5	8C	Common +8V.
	6	BEEP	Beep output(From CPU IC201).
	7	A2	Audio output (From AF volume).
	8	A1	Audio input (To AF volume).
	9	AE	GND
	10	TONE	TONE output (From CPU IC201).
	11	ME	MIC GND.
	12	MO	Modulation output(From MIC amplifier).
	13	E	GND.
CN203	1	RD	CTCSS unit voice de-modulation input.
	2	5C	+5V.
	3	E	GND.
	4	SDO	CTCSS unit tone matching input.
	5	TO	Not used.
	6	STC	CTCSS unit connect/enable output.
	7	DTC	CTCSS unit data output.
	8	CKC	CTCSS unit clock output.

LEVEL DIAGRAM (K,M2)

AF level obtained when the AF output level is adjusted for 0.63V/8Ω with the front panel AF VOL control.
Measured with AF voltmeter connected to the external speaker jack, receiving a -73dBm SSG signal modulated at 1kHz, DEV 3kHz.

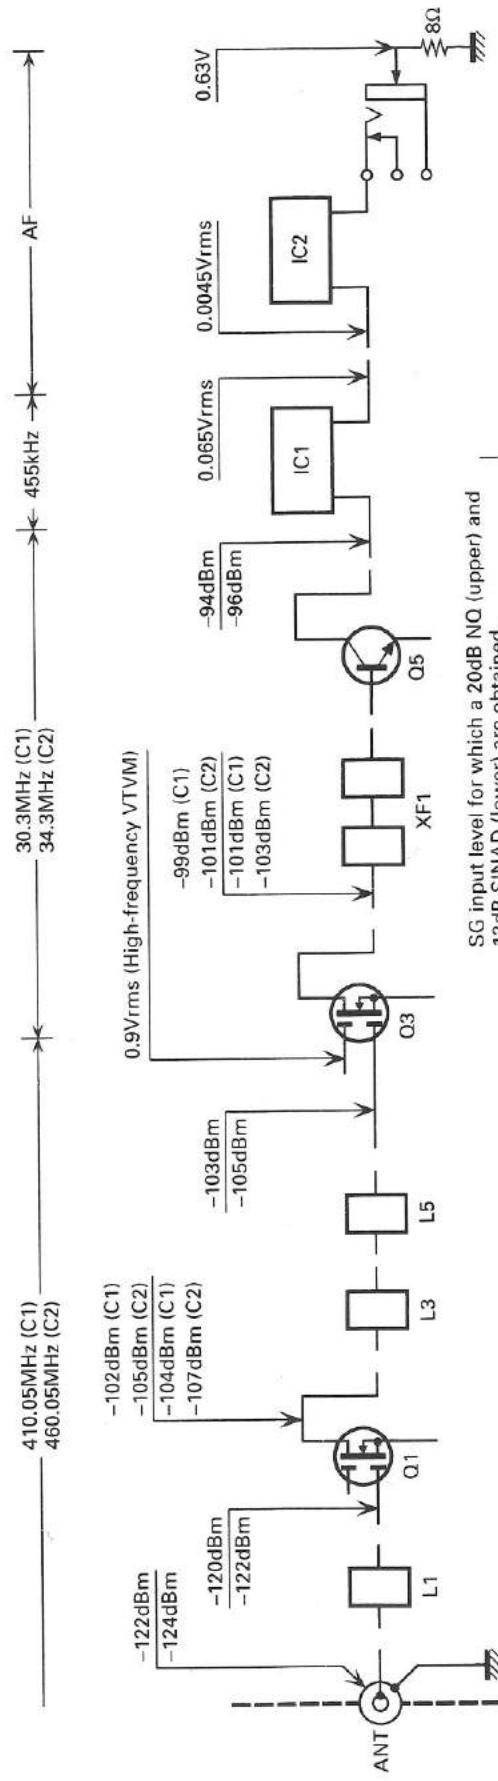

TX Section

1. Ag is set so that MIC input becomes 3kHz DEV at 1kHz MOD.
2. Transmitting frequency : 435.06MHz

LEVEL DIAGRAM (C1,C2)

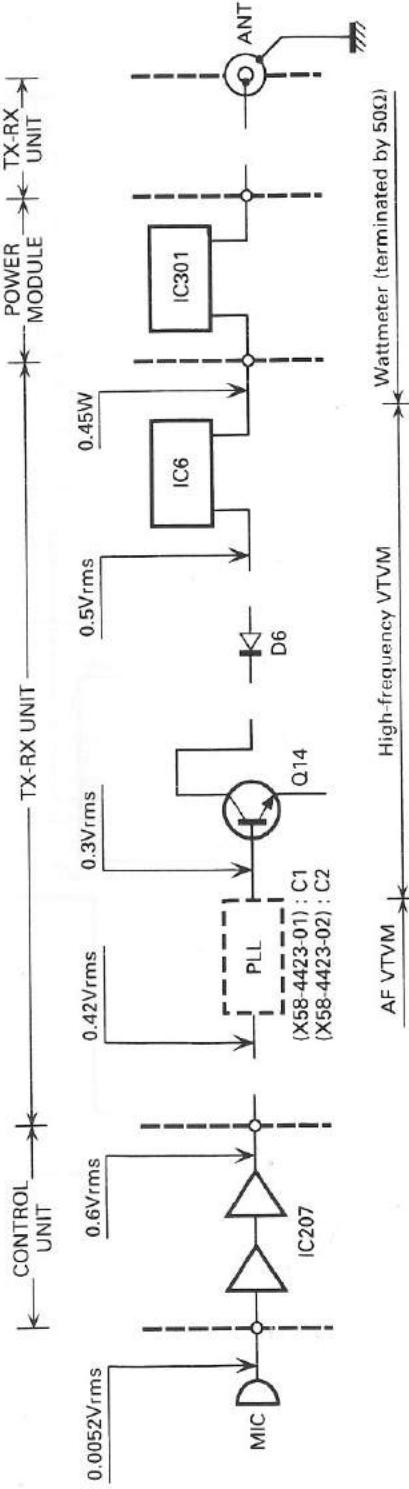

RX Section

SG input level for which a 20dB NO (upper) and 12dB SINAD (lower) are obtained.
Measured by connecting the SG to each point via a 0.01μF capacitor.

AF level obtained when the AF output level is adjusted for 0.63V/8Ω with the front panel AF VOL control.
Measured with AF voltmeter connected to the external speaker jack, receiving a -73dBm SSG signal modulated at 1kHz, DEV 3kHz.

TX Section

- Ag is set so that MIC input becomes 3kHz DEV at 1kHz MOD.
- Transmitting frequency : 410.05MHz (C1), 460.05MHz (C2)

SPECIFICATIONS

General

Frequency range	
U.S.A./Canada	438 to 450MHz
China	400 to 420MHz or 450 to 470MHz
General	430 to 440MHz
Mode	F3E (FM)
Antenna impedance	50Ω
Usable temperature range	-20°C to +60°C (-4°F to +140°F)
Power supply	13.8V DC ± 15% (11.7 to 16.0V)
Grounding method	Negative ground
Current	
Transmit (max.)	10.0A or less
Receive (no signal)	0.6A or less
Frequency stability	Within ±10ppm
Dimensions (W x H x D projections not included)	140 x 40 x 160.5 mm / 5-1/2" x 1-9/16" x 6-5/16"
Weight	1.0kg / 2.2lb

Transmitter

Power output	
High	35W
Medium	10W
Low	Approx. 5W
Modulation	Reactance
Spurious emissions	-60dB or less
Maximum frequency deviation	±5kHz
Audio distortion (at 60% modulation)	3% or less
Microphone impedance	600Ω

Receiver

Circuitry	Double conversion superheterodyne
Intermediate frequency (1st / 2nd)	
U.S.A./Canada/General	30.825MHz / 455kHz
China	30.3MHz / 455kHz or 34.3MHz / 455kHz
Sensitivity	
12dB SINAD	0.16µV or less
-6dB	12kHz or more
-60dB	28kHz or less
Squelch sensitivity	0.1µV or less
Audio output (8Ω, 5% distortion)	2W or higher
Audio output impedance	8Ω

Specifications are subject to change without notice due to developments in technology.
