## 9R90C UHF RECEIVER

## 1 SPECIFICATIONS

POWER REQUIREMENTS 1W AF	13.6 VDC at 280 mA. typ.
POWER REQUIREMENTS STD. BY	13.6 VDC at 130 mA. typ. (80 mA. speaker off).
FREQUENCY	406 to 512 MHz.
SENSITIVITY	0.30 uV for 12 dB SINAD.
SELECTIVITY EIA SINAD	75 dB at +/-25 kHz.
FREQUENCY STABILITY	+/-0.0005%, -30 to +60 deg. C.
INTERMODULATION EIA SINAD	65 dB.
SPURIOUS RESPONSE	85 dB, [75 dB 470 to 512 MHz.]
AUDIO OUTPUT	1 watt [8 ohms] at less than 5% THD.
AUDIO RESPONSE (LOW-LEVEL OUTPUT)	+1, -2 dB from 6 dB/octave. de-emphasis, 300 to 3000 Hz.
HUM AND NOISE	-50 dB from 3.0 kHz. deviation at 1000 Hz.
SIZE L x W x H	260mm x 60mm x 108mm

## 2 DESCRIPTION

The 9R90C receiver is a single-conversion frequency-modulation receiver contained in a plug-in module. Power, control and audio connections are made through a rear-mounted 15-pin connector. A front-panel 14-pin metering receptacle is provided for test and alignment using a model M90 Test Set.

## 3 FUNCTIONAL CONNECTIONS [by pin number]

1 +13.6 V	+13.6 volt supply input.
2 +13.6 V	+13.6 volt supply input.
3 SW +8.0V	+8.0V switched by the Line/Local channel selector switch; this output is used to enable line channel selection.
4 SPEAKER	Speaker AF out.
5 COS	Receiver squelch output.

## 9R90C UHF RECEIVER

## 8 RX MUTING

Muting input. With +8.0V applied to this pin, the receiver will be muted.

## 11 RX AF

Low-level receiver audio output. This output is used by external facilities.

## 12 OSC 1

Channel 1 oscillator control.

## 13 OSC 2

Channel 2 oscillator control.

## 14 GND

Common ground.

## 15 GND

Common ground.

## 4 CIRCUIT DESCRIPTION

## 4.1 CONVERTER

The RF amplifier, Q1, amplifies the input signal to overcome the loss of the five helical resonators L1,2,4-6 and the noise level of the mixer, Q2. The mixer is a base-injected bipolar transistor mixer which heterodynes the signal down to the 10.7 MHz. IF.

Q6 [Q7] is the oscillator for channel 1 [2]. The crystals Y1 and Y2 are third-overtone at a frequency of [channel-10.7 MHz.]/9. The channel switch S1 is installed in two-channel models. This switch has three positions and is located on the front-panel. In the center position, external channel selection is enabled through pin 3 of P1.

## 4.2 IF AMPLIFIER

Filter FL1-2 provides the prime selectivity of the receiver. IF Amplifier-1 (Q3) sets the IF noise figure and has filter FL3-5 to restrict the noise bandwidth applied to later stages. IF Amplifier-3 [U1] further amplifies the 10.7 MHz. signal for application to the Limiter, U2.

FM demodulation is carried out with CR4,5 with C45 removing 10.7 MHz. components from the demodulator output. The IF amplifier stages are contained in a shielded compartment to ensure stability and reduce unwanted pick-up of extraneous signals.

## 9R90C UHF RECEIVER

### 4.3 AUDIO AMPLIFIER

The AF amplifier, U4, amplifies the low level demodulator output for processing. R48 and C87 form a de-emphasis network. The output of U4 is coupled through C94 to the volume control R83. After passing through the volume control, the signal is amplified by the final audio amplifier U6.

The speaker switch allows the reduction of stand-by current drain by disabling the audio power stages when speaker operation is not required.

The Output Buffer, U5, is a separate circuit which provides a high quality low level RX AF output at pin 11 of P1. This output is used by external accessories.

### 4.4 SQUELCH

The output of Noise Amplifier-1 (Q10) is fed to a high-pass filter C78,79,80 and CH10,11 which removes the voice-band components of the demodulator output. U3 amplifies the remaining noise for detector CR11. The SQ-KEY control, R66, sets the collector voltage and the gain of Q10, and thus the unmuting SINAD.

Q11 is the detector switch that activates the muting in U4 (pin 4) and squelch gate Q15. The output of inverter-buffer Q14 is connected to pin 5 of P1 where it is available for external circuits that utilize a carrier operated switch or COS. CR8, CR14 and U8 will mute the receiver and disable the channel oscillator when +8.0V is applied to pin 8 of P1, RX MUTING. This connection is used for simplex operation.

### 4.5 POWER SUPPLY

U7 generates the +8.0 volt supply which powers all circuits except the final audio amplifier. This amplifier is powered directly from the 13.6V input.

## 5 ADJUSTMENTS

### 5.1 EQUIPMENT

The following test equipment and tools are recommended for performing the various adjustments

RF signal generator -127 dBm to -27 dBm

AF distortion analyser 1000 Hz. 8 ohm term.

## 9R90C UHF RECEIVER

Power supply	11 to 16 VDC at 0.5 A.
IF marker generator	10.7 MHz. crystal control
Test set	WR M90 Test Set
Tuning tools	Insulated
Screwdrivers	Slot, Phillips and Robertson head.

## 5.2 ALIGNMENT

Set the power supply voltage to 13.6 volts. Connect the power supply and RF signal generator to the receiver module at P1 and J1 respectively. Connect the speaker output, pin 4 of P1, to the AF distortion analyser. Plug the Test Set into the front-panel connector and follow the instructions in Table 1, Receiver Alignment.

Table 1:- Receiver Alignment

Test Point	Test Set Range uA	Typical Reading uA	Align	Set to
1	50	16	L15	Note 1
2	100	55	L16	max.
3	50	15 Note 2	C1,2,6,7,8, 70,13	max. Note 3
4	50	0	L11,12	Note 4

**Note 1** Tune to a peak then decrease to 80% of the peak by increasing the inductance of L15. The final reading at the test point should be about 16 uA.

**Note 2** 15 uA reading is for 10 uV at J1 after alignment (approximate).

**Note 3** After tuning C1,2,6,7,8, the crystal Y1 [Y2] must be set on frequency before the IF (L8-10) is aligned.

Set the RF generator exactly on frequency and to a level that does not saturate the IF.

Couple the IF marker to the IF for a beat note.

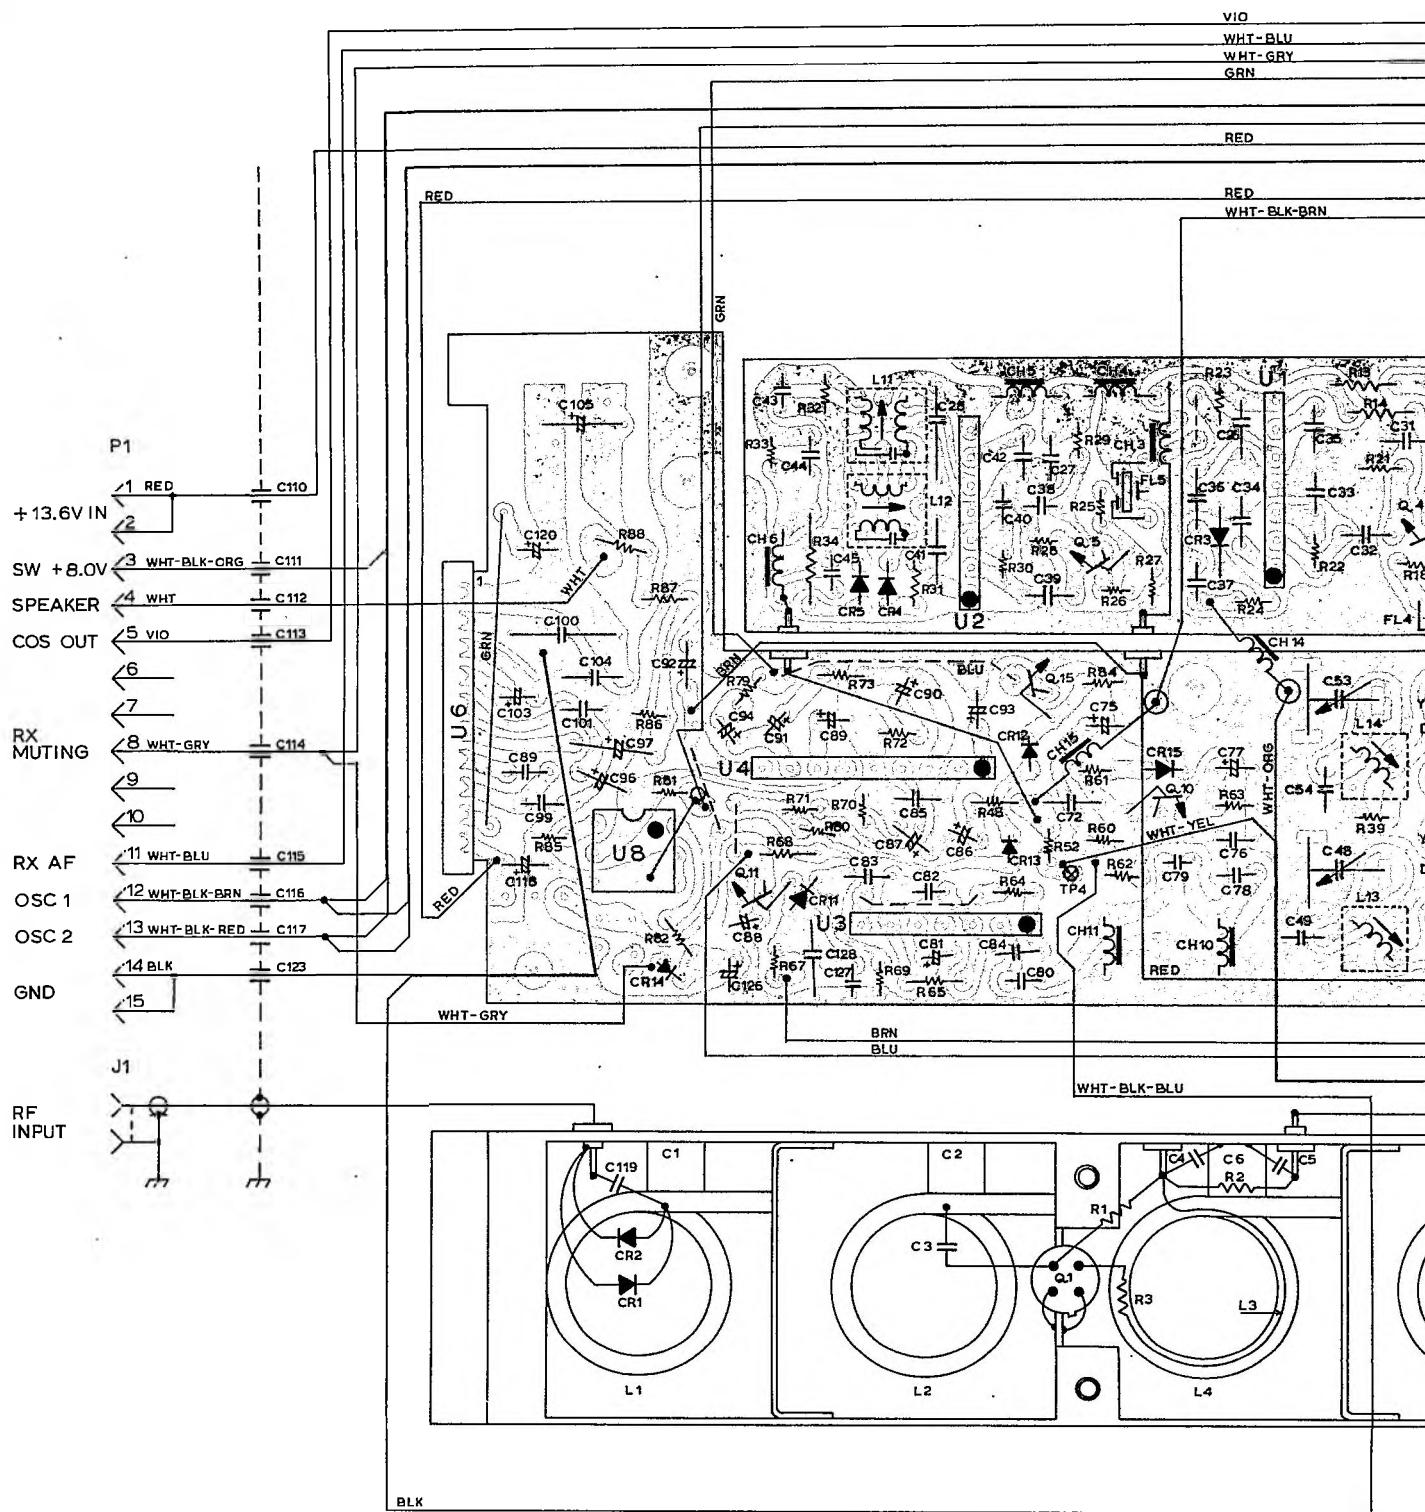

9R90C UHF RECEIVER

Set C48 [C53] controls for zero beat. L13,14 provide coarse adjustment. Note that later tuning of L15 pulls frequency slightly.

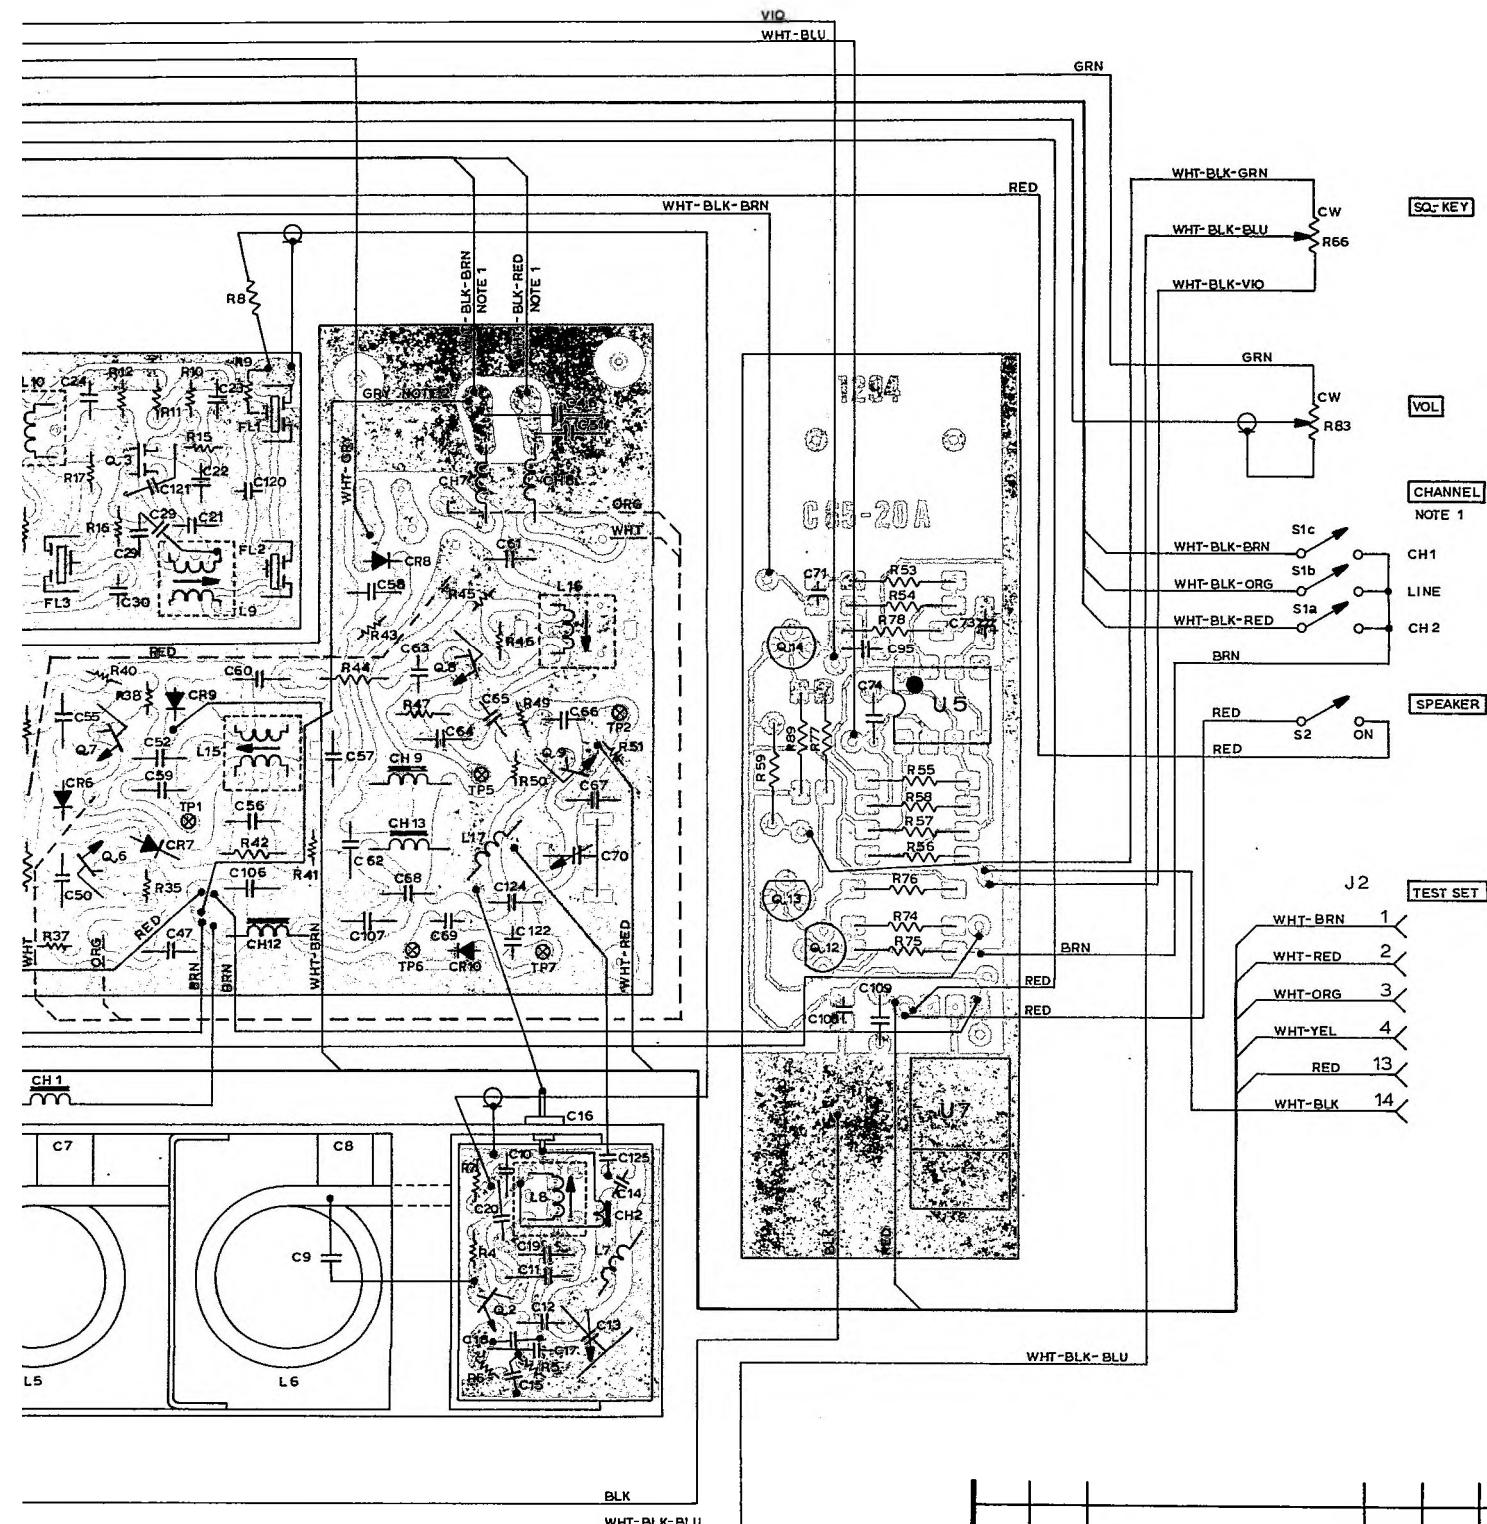

Note 4 Set the volume for 1 Vrms at the speaker for a 1 mV[RF], 3.0 kHz deviation, 1 kHz tone signal at J1 that is exactly on the channel frequency.

Tune L11 for a peak at the speaker output.

Tune L12 for a reading of 0 uA at test point 4.

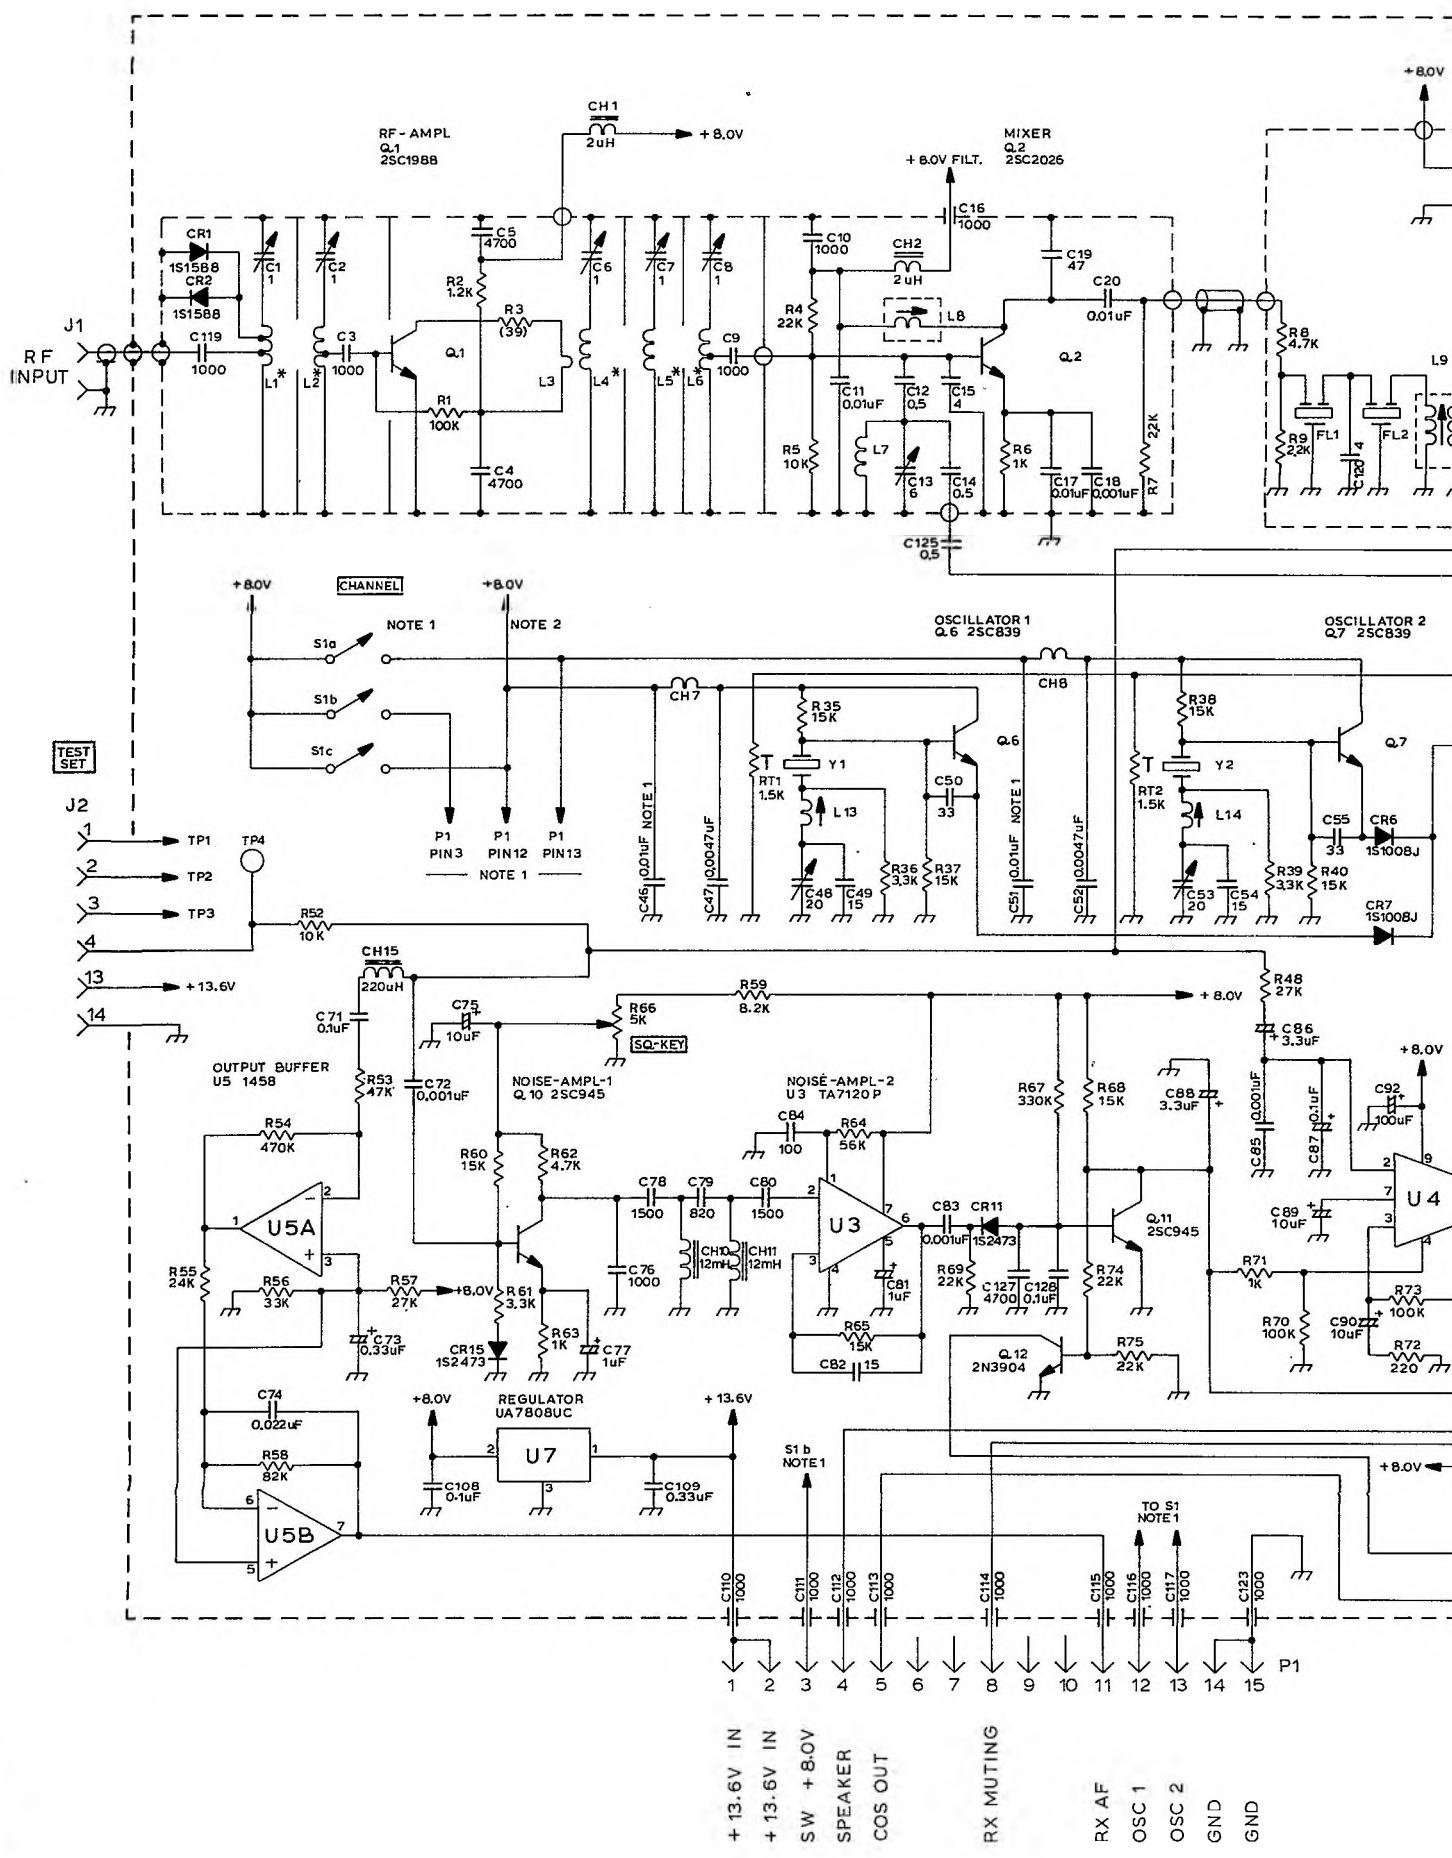

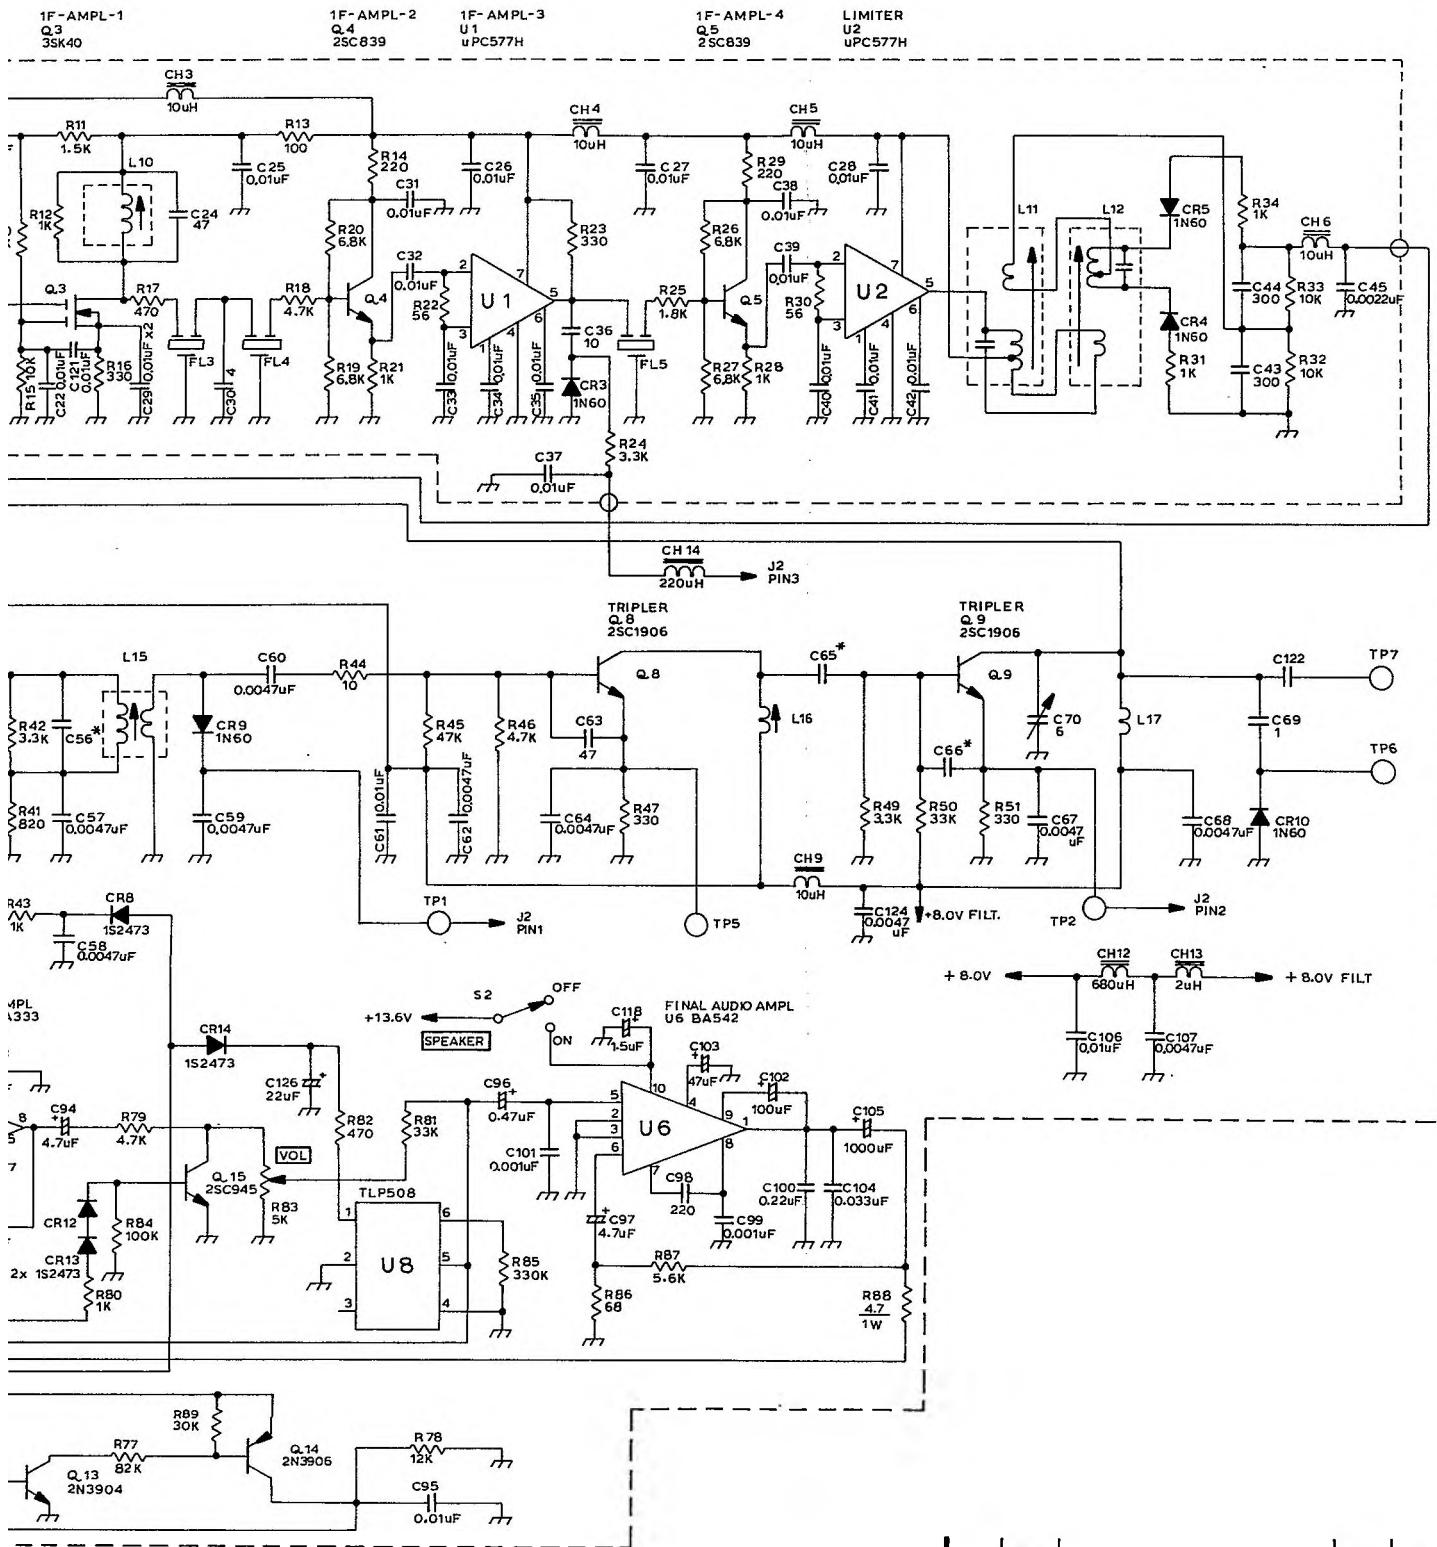

NOTE 1:
